Hiring Team, Cursor

At Sensata I took a sensing line that only engineers could explain and turned it into positioning distributors and OEM engineers acted on inside a year, closing at \$2M+ in first-year revenue. That is the job your posting describes for Cursor: translate a deeply technical product into a story a developer trusts enough to act on.

My opinion on developer-facing marketing is that most of it fails for one reason: someone writes the copy without ever sitting with the person who has to use the product. I ran 30+ interviews with OEM and distributor engineers before I wrote a word of positioning, and I built the sales/GTM enablement 50+ reps carried into those same technical conversations, which is why win rates moved 30%. I would run that same loop on Cursor's launches: sit with the developer first, then write the story, then build what sales and GTM need to repeat it.

I am not marketing AI from the outside looking in. At Applied Materials I automate recurring market and pricing analysis with agents built on Claude, and before that I built an AI product myself: SwipeHire, an OpenAI API job-matching tool I wrote the PRD for and coded end to end in Python and React, then got in front of 50+ early users and ran the A/B tests to lift activation 25%. Knowing what it actually costs an engineer to ship a feature is the difference between positioning that sounds good and positioning that survives a developer's skepticism.

I would like to bring that discipline, sit with the user, write the narrative, ship the enablement, to Cursor's launches. Proof trail at adhi-product-ai.vercel.app/ref/cursor.
