Hiring Team, Sigma Computing

Sigma Apps needs someone who can take a no-code capability and put a battlecard in a rep's hands before a competitor gets there first. That is close to the day job at Sensata: I turned dense sensor specs into positioning and enablement for OEM engineers, and the launch it supported drove \$2M+ in first-year revenue and a 15% lift in conversion.

I built the enablement that made that launch stick: battlecards, case studies and one-pagers for 50+ reps, and I ran 30+ structured interviews with OEMs and distributors to turn win/loss patterns into messaging before it shipped, not after. That is the same loop a battlecard for the no-code and enterprise application development space needs: real signal from the field, not a guess about what a technical buyer wants to hear.

The BI and analytics side is where I already live day to day: SQL, Power BI, Tableau and Databricks show up in my own reporting, and at Applied Materials I run AI agents built on Claude to automate the repetitive parts of competitive analysis instead of rebuilding the same report every cycle. Writing thought leadership on AI-assisted workflow automation reads differently when you run the tools yourself.

What I would bring to Sigma Apps is a launch loop that already ran once: positioning built from real technical depth, tested against the buyer, armed for sellers and case-studied for the next launch. Proof trail at adhi-product-ai.vercel.app/ref/sigmacomputing.
