Hiring Team, Anrok

At Sensata, the sales enablement I built, battle cards, case studies and objection-handling decks for 50+ reps, moved win rates 30%. That is the job this role is asking for: own the assets sellers actually use, grounded in how buyers evaluate, so objections get handled and deals move instead of stalling. I built that enablement alongside owning the GTM for a new product line end to end, positioning through launch, which is what let the messaging hold up once sales was repeating it in the field instead of reading it off a slide.

The metrics side of this work is where I spend the most time, not the least. At Sensata I built the Power BI system that tracked 1,200 pricing opportunities against a $627M target across three regions, with win-rate, pipeline-stage and dollars-per-win views built in, the same discipline I would bring to tracking pipeline influenced, sales-asset utilization and feature adoption here. I do not wait to be asked for the dashboard; I build it so the answer is already there when the question comes up.

I also like sitting in the seam between product and sales, which is where this role lives. At Applied Materials I turn field input from Sales, Engineering and Accounts into one market view, and I automate the repetitive parts of that work with AI agents built on Claude so the analysis keeps pace with the business instead of lagging behind it. Tax infrastructure is a category where a buyer has to trust the message before they act on it, and that is the positioning problem I like most: taking something technical and a little intimidating and making it something a commercial, mid-market or enterprise buyer can say yes to quickly.

More of this, positioning work, enablement assets and the pricing dashboard, sits at adhi-product.vercel.app/ref/anrok if useful.
