Hiring Team, Scribe

Autocapture's job, turning what already happened into documentation nobody had to remember to create, is a problem I have actually built, not just studied. SwipeHire, the AI job-matching platform I shipped zero-to-one on Python, OpenAI's API and React, auto-generated tailored resumes straight from a candidate's raw history instead of asking them to write one. That is the same bet Scribe is making at a much bigger scale: capture the work as it happens, then make the resulting record good enough that nobody notices it was automated.

I own the product roadmap and a 100+ feature backlog for sensor solutions at Sensata, working with Engineering in Agile across 3 regions. I do not start from a clean spec. I ran 30+ structured interviews with OEMs and distributors to find where the real breakdown was, then checked that against SQL and GA4 data before committing to a fix, work that cut time-to-market 20% and lifted CSAT 22%. That is the habit your posting calls chasing the why, why, why, and it is also what keeps a roadmap honest about outcomes instead of just shipping output.

I tinker with AI past the point most PMs do. At Applied Materials I automate repetitive analysis with agents built on Claude, and building SwipeHire forced me to develop real taste for where an AI workflow feels magical versus where it just adds friction, since users only forgive the first kind. I have an opinion worth arguing with: a documentation agent that waits to be told what matters will always lag one that learns it on its own, and that is the harder, more interesting version of Autocapture worth building toward.

I would welcome the chance to talk through how this maps to the Autocapture roadmap. Proof trail at adhi-product-ai.vercel.app/ref/scribe.
