Hiring Team, Anaconda

At PriceKeel I built the company's CRM and CPQ from nothing: deal approvals, forecast reviews and pipeline reviews all run through a system I designed myself, with an audit trail Finance can actually rely on. Your posting asks for someone who owns that same stack on Salesforce or an equivalent platform, and that is the exact muscle I use every week.

The reporting side is where I spend most of my time. At Sensata I built the FY2026 Bleeders and Leakers Power BI dashboard, tracking 1,200 pipeline opportunities against a \$627M target across 3 regions and 20 product lines, and used it to independently diagnose \$433M in margin gaps that turned into \$700K recovered in two quarters. I shaped AP26 revenue models and multimillion-dollar customer quotes alongside senior executives in that same cycle, so building a forecast leadership can defend is not new work for me.

Anaconda's own users live in Python and SQL every day, and so do I. I build KPI frameworks in SQL, run my own forecasting in Python and pandas, and automate the recurring parts of it with Claude agents at Applied Materials. I think a GTM Ops partner who can open a notebook alongside your own users, not just read a slide about them, is worth more at a company like this one than at most.

I would like to bring that same CRM-to-forecast discipline to Anaconda's GTM team. Proof trail at adhithyabhaskar.vercel.app/ref/anaconda.
