Hiring Team, Heartflow

Plaque Analysis is a new line inside a product suite that already has adoption muscle built around FFRCT, so the job is less about proving the clinical case from scratch and more about giving the field team a reason to lead with it. That is the exact shape of work I did at Sensata: I owned GTM for a brand new sensing product line across North America and Europe, positioning, pricing, channel and launch, and the first year closed at $2M+ because the field had a story it could repeat, not a spec sheet it had to translate.

Your posting is specific about wanting content that trains the salesforce, not another deck nobody opens. I built that library once already, decks and case studies for 50+ reps, and win rates moved 30% because the materials answered the objection reps actually heard in the room. Getting there took 30+ structured interviews with OEMs and distributors before I wrote a line of messaging, the same understand-the-barriers-before-you-write-the-plan discipline this role asks for with cardiologists and CV administrators.

I have spent the last year translating a technical, regulated product into a value story a buyer who is not an engineer can act on, at Applied Materials, where the specification is a wafer process instead of a coronary scan. The translation skill transfers; I would spend the first weeks here the way I spent them there, in the room with Medical Affairs and the Field Advisory Board, until I can write the value proposition the way your own clinicians would say it.

I set metrics and measure what I ship, and I already automate the repetitive half of that analysis with Claude agents at Applied Materials, which is where the hours for the real strategy work actually come from. Proof trail at adhi-product.vercel.app/ref/heartflow.
