Hiring Team, Intapp

Your posting names structuring ambiguous problems and synthesizing a clear recommendation from evidence as the primary screen for this role, and that is the exact method I ran leading a 5-consultant team through Safran's TAM/SAM/SOM engagement: 170 facilities, no existing framework, down to a defensible SAM of 28 and a market-entry case presented directly to Safran's leadership.

Primary and secondary research is where I would start building Intapp's thought-leadership program. At Sensata I ran 30+ structured interviews with OEMs and distributors before writing a line of messaging, then benchmarked competitors across 10+ players to inform pricing and positioning, the same research-before-recommendation discipline your survey design and competitive-analysis bullet describes.

Executive-level storytelling is the other half of the role, and it is where the research has to land. I built the sales enablement content and case studies that lifted win rates 30% across 50+ reps at Sensata, and owned the GTM for a brand new product line that closed its first year at $2M+ because the story was clear enough for the field to repeat it.

Operating-model design for a new, scaling function is not abstract to me either: I build the forecasting models and market views that keep a new semiconductor product line's pricing in sync with demand at Applied Materials today, and I already use Claude agents to accelerate that research.
