Hiring Team, Hightouch

Your posting frames the Real-Time suite as a problem of milliseconds: capture behavior the instant it happens, evaluate it against everything already known, and answer before the moment passes. That is a sharper version of a problem I have already lived in: at Sensata I built the SQL and GA4 KPI frameworks that mined event-level signals off 50K+ connected industrial devices to find the cohorts worth acting on, then worked directly with Engineering to turn that into a 100+ feature backlog shipped 25% faster. Stale data was never an option there either; a sensor reading loses its value almost as fast as a storefront re-rank does.

The posting also asks for technical depth that holds up in front of engineers, not just a roadmap that sounds good in a review. I carried P&L and revenue targets at Sensata while building forecasting and pricing models with real architecture tradeoffs baked in (a BU-wide Power BI model that flagged where a change moved profitability more than 50%, driving +12% YoY revenue), and at Applied Materials I partner with Engineering and Sales directly to turn field and technical signal into one forecast. I am comfortable being in the room when the system-design conversation gets specific.

Customer evidence is the other half of this role, and I built that muscle the hard way. I ran 30+ interviews with OEMs and distributors at Sensata to separate what partners asked for from what the product actually needed, raising CSAT 22%, and at Pixis I read live campaign behavior in Amplitude across 30+ campaigns to cut client churn 50%. Both jobs taught me the same lesson Real-Time will test every week: the customer's stated want and the system's real signal rarely match, and the job is closing that gap fast.

I am currently Strategic Marketing III at Applied Materials, where I build Claude AI agents to ramp into new technical domains faster, which is the same build-first habit your posting asks for. I would like to bring that combination of event-level data work, pricing rigor and direct engineering partnership to the Real-Time suite. Proof trail at adhi-product-ai.vercel.app/ref/hightouch.
