Hiring Team, Intercom

I built SwipeHire, an AI job-matching platform, from a blank Python file to 50 plus users: wrote the PRD, scoped the MVP, and hand-configured the matching logic myself instead of handing that piece to someone else. That is the same instinct a Forward Deployed PM needs when a customer's deployment stalls on a configuration problem nobody else in the room can unblock.

At Sensata I ran 30 plus interviews with OEMs and distributors to find the real problem in a deployment before proposing a fix, then fed what I learned back into a 100 plus feature roadmap I owned with engineering across 3 regions. Running that loop, customer conversation in, product change out, cut time-to-market 20% and lifted CSAT 22%. That is the field-to-product loop this role is built around, just pointed at a different product.

The technical side comes from the same habit. I owned an 8-client portfolio end to end on an AI adtech platform at Pixis, carrying P&L and configuring each account by hand, and more recently wired an agentic Claude API reasoning layer into a live Python scanner for a trading bot. Explaining an API integration to an engineer and a renewal risk to a VP are two different conversations, and I have run both on a weekly basis.

The most interesting part of this role is that the playbook is not written yet. I would rather build it with your biggest customers than inherit one. Proof trail at adhi-product-ai.vercel.app/ref/intercom.
