Hiring Team, Apple

Running a 100+ feature backlog across 3 regions at Sensata taught me that a platform roadmap breaks the moment one region's priority list drifts from another's. I kept Engineering, Sales and distributor partners reading the same roadmap and cut time-to-market 20% doing it. Your Access platform spans home, car, office badge, hotel and event unlocking across partners and geographies that almost certainly argue about priority just as often, which is the part of this posting that reads most like work I already do.

The commercial half of your posting (business models, pricing, partner value propositions, go-to-market) is the part most candidates list and few have actually built end to end. I built that model myself for SwipeHire: modeled 3 subscription pricing tiers from competitor benchmarks and willingness-to-pay signals, then shipped it alongside the PRD and MVP. As Sensata's Pricing Lead I ran the same build at B2B scale, designing and defending a repricing model against 10+ competitor benchmarks that drove +12% YoY revenue.

Evangelizing a platform to outside partners is also not new ground for me. I ran 30+ structured interviews with OEMs and distributors to find where their priorities and ours actually diverged, then carried those insights into sales enablement that moved win rates 30% for 50+ reps: the same translate-partner-needs-into-one-story work the Access verticals will need across Wallet, Payments, Commerce, Engineering, Design and Marketing, while keeping the end result anchored in what actually serves the person tapping their phone to get into a hotel room or badge into an office, not just the partner's integration spec.

I would like to bring that same discipline (build the roadmap, defend the commercial model, keep the partners aligned) to Apple's Access platform. Proof trail at adhi-product-ai.vercel.app/ref/apple.
