Hiring Team, Amplitude

At Sensata I ran the Bleeders and Leakers program, tracking 1,200 pricing decisions against a $627M revenue target across three regions and twenty product lines, and used that view to structure non-standard distributor terms that took channel margins from 53% to 61%. That is the muscle a Deal Desk Manager needs most: not a pricing policy memo, but a system that tells you exactly where a non-standard deal is worth the exception and where it is not, fast enough that Sales does not stall waiting on an answer.

I am building that same system right now as founder of PriceKeel, a decision-integrity layer for B2B SaaS deal pricing. It flags a non-standard discount or packaging request inside the deal platform before it reaches final approval, and keeps an audit trail that gives Finance a revenue-recognition-ready record behind every decision, the same checkpoint your team runs across Sales, Finance, Legal and Order Management. I run the CRM and Salesforce CPQ configuration myself, so I know what breaks when a quote-to-order process is left to manual judgment call after manual judgment call.

At Applied Materials I automate repetitive pricing and forecasting work with AI agents built on Claude, the same instinct your team names when it talks about leveraging AI and automation to scale deal operations. I carry P&L and revenue targets in that role, and I gravitate toward the parts of commercial work where a bad call costs the business real money, which is exactly what a Deal Desk Manager is trusted to prevent.
