Hiring Team, Netic

I am building a deal desk from zero right now, as founder of PriceKeel: no inherited approval matrix, no pricing playbook, just a guardrail engine I had to design myself, learned from each company's own closed-won and closed-lost deals. That is the exact brief on this role. There is no process to tune here, there is a process to invent, and I am already in the middle of inventing one.

Before PriceKeel I spent the deal economics reps at Sensata, leading the Bleeders and Leakers program: modeling 1,200 deal-level pricing decisions against a $627M target across three regions, surfacing $433M in margin gaps by rep and product line, and recovering $700K+ in margin in two quarters by restructuring discount and multi-year terms against competitive gaps and customer willingness to pay. That is the same deal-economics-at-the-deal-and-portfolio-level work your first year success criteria describe, just run inside a $627M industrial book instead of a usage-based SaaS one.

At Applied Materials I automate repetitive pricing analysis with AI agents built on Claude, the same automate-approvals-as-volume-grows instinct behind the CPQ standards you want a Deal Desk to set with Sales Ops. I am comfortable building the model myself in Excel or SQL before anyone asks for a tool to do it, and comfortable holding a line with a sales leader when the data says no.
