Hiring Team, Okta

Your posting describes forecasting as a process with a feedback loop built in: own the weekly and quarterly cycle end to end, then keep accuracy tracking on top of it so the team knows when the number was wrong and why. That loop is the job I already run. At Sensata I built the FY2026 Bleeders and Leakers Power BI dashboard, tracking 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with a pipeline funnel and stage distribution that let us trace every miss back to a segment, a salesperson, or an assumption that needed fixing before the next cycle.

Capacity and book-of-business visibility is the other half of that same instinct. Managing an 8-person team across 8 client accounts at Pixis meant I could not run the business without a clear read on account health and territory load, which is part of why client churn fell 50% under that model. Raising distributor and channel-partner margins from 53% to 61% at Sensata ran on the same logic: target setting tied to a tracked number, not a one-time fix.

Recurring accountability reporting is where I spend most of my current week. As founder of PriceKeel I run the company's own CRM, CPQ configuration and forecast and pipeline reviews, and I built the audit trail that gives Finance an explainable record behind every pricing decision, so the reporting holds up when someone asks why. At Applied Materials I direct AI agents built on Claude to generate the first pass on repetitive analysis and own the judgment on top of it, the same analysis-and-automation split your posting asks for: understand the tables and sources well enough to know when the AI-generated answer is right.

A 67-person Renewals org running on forecasting, capacity modeling and self-service reporting is a scale problem I would like to help own. Proof trail at [adhithyabhaskar.vercel.app/ref/okta](https://adhithyabhaskar.vercel.app/ref/okta).
