

PITCH DECK | BLUEBEAM SAAS PRICING AND PACKAGING MANAGER

This seat owns customer-backed pricing and packaging recommendations, the KPIs that prove they worked, and the cross-functional alignment to ship them. I have already run that loop end to end, just not yet for construction software.

Pricing and packaging judgment, revenue-impact modeling and cross-functional project management from someone who has closed a quantified margin gap, not just proposed one.

\$700K+ margin recovered in 2 quarters via data-driven pricing recommendations at Sensata

53% to 61% distributor margin lift, validated against historical data

1,200 opportunities tracked against a \$627M target with win-rate and stage KPIs

3 packaging tiers modeled from competitor benchmarks and willingness-to-pay signals

Claude AI agents automating recurring pricing analysis at Applied Materials

A pricing and packaging recommendation that skips the KPI loop does not fail loudly. It fails as a tier nobody can defend at the next review, **quarters after it shipped.**

What losing that discipline runs into

Customer research and willingness-to-pay data are easy to collect and easy to misread. Without a defined set of metrics and a model that projects second-order effects, a packaging change looks right in the room and wrong two quarters later.

Product, Sales, Marketing and Operations all touch the same pricing decision, so a gap in project management or in the business case becomes everyone's guessing game at the next cross-functional review.

The fix is not another workshop. It is someone who treats research, modeling and governance as one connected discipline instead of three separate jobs.

What I have already run

At **Sensata**, I converted customer research and competitive data into pricing recommendations, then built the Power BI system that defined the KPIs proving whether they worked across 1,200 opportunities.

At **PriceKeel**, I built the audit trail and durable governance process that keeps a pricing decision defensible after the fact, not just at the moment it is proposed.

Both mean I have sat on the research-and-recommendation side and the KPI-and-governance side of the same decision, not just one or the other.

A Pricing and Packaging Manager who designs analytical tests, defines effectiveness metrics, models revenue impact and runs cross-functional execution is describing this exact loop: research the need, model the decision, prove it held.

What the Pricing and Packaging Manager opening asks for, and where the proof already sits.

What the role covers

- Conduct complex customer research and market analysis to identify customer needs, external drivers, trends, and willingness-to-pay that inform pricing and packaging recommendations.*
- Design and execute analytical tests and define the metrics and KPIs that measure the effectiveness of pricing and packaging decisions, iterating to maximize impact.*
- Model pricing and packaging decision impact, including second-order effects, and validate the models against historical data.*
- Provide day-to-day project management on pricing and packaging opportunities requiring cross-functional execution across product, sales, marketing and operations.*

My Proof

- Customer research into recommendations:** ran 30+ customer interviews with OEMs and distributors at Sensata to surface willingness-to-pay signals, then modeled three packaging tiers from competitor benchmarks and willingness-to-pay data on my own product.
- Effectiveness metrics and KPIs:** built the Bleeders and Leakers Power BI dashboard, defining win rate, avg \$/win and stage distribution as the KPIs that proved \$700K+ in margin held across 1,200 opportunities.
- Revenue-impact modeling, validated:** built AP26 revenue models and a BU-wide price-increase model, validating both against the prior two quarters' closed deal data before any recommendation shipped.
- Cross-functional project management:** partnered with senior executives on multimillion-dollar customer quotes at Sensata, and set up and run CRM, CPQ and deal approvals end to end at PriceKeel.

Bleeders and Leakers: validate a pricing recommendation against historical data before it reaches a review.

Built as a BU-wide Power BI system covering 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with the funnel, win rate and stage-distribution KPIs that leadership used to prioritize the next quarter's pricing calls.

\$700K+

Margin Recovered, 2 Quarters

A customer-research-backed pricing recommendation, validated against competitive gaps and each customer's own deal history before it shipped.

53% to 61%

Distributor Margin Lift

A packaging and discount-structure change checked against second-order effects on channel behavior before it held past the first quarter.

\$433M

Margin Gaps Surfaced

Every gap traced to a specific segment by salesperson and product line, the same granularity a cross-product KPI set needs to mean anything.

At PriceKeel that same instinct became the operating model: I run the CRM, CPQ configuration and the audit trail myself, so a pricing decision and the data behind it are never two different stories.

What the first month owning pricing and packaging recommendations at Bluebeam looks like.

WEEK 1

Learn the current pricing and packaging stack

Sit with Product, Sales and Marketing to walk the Build and Construct Division's current tier structure, pricing data sources and decision-approval process, and shadow one cross-functional pricing review end to end.

Why first: the same instinct that had me learn PriceKeel's own CRM and CPQ configuration before building anything on top of it.

WEEK 2-3

Run one willingness-to-pay test and its model

Take ownership of one customer research or analytical test end to end: define the metrics it needs to prove, build the revenue-impact model with second-order effects, and validate it against the last two quarters of historical data.

Why now: the same validate-before-ship discipline that made the Bleeders and Leakers dashboard trustworthy in a leadership review.

WEEK 4

Ship a data-driven business case, cross-functionally

Turn the test into a business case, present it to Product, Sales, Marketing and Operations, build alignment on the recommendation, and document the KPI and governance trail for the next cycle.

Why this fast: a pricing recommendation only earns its keep if the cross-functional group that has to live with it signs off early.

CLOSE

You are hiring someone to turn customer research into a pricing and packaging recommendation that still holds after the KPIs come in. I have already built that discipline, from research to validation.

The core proof is Sensata: a Power BI system tracking **1,200 pricing opportunities against a \$627M target**, distributor margins lifted **from 53% to 61%**, and \$700K+ in margin recovered in 2 quarters through research-backed pricing recommendations that were validated, not just proposed.

What is harder to find is someone who has also modeled packaging tiers from willingness-to-pay data on their own product and who runs the CRM, CPQ and governance trail for their own company's pricing decisions. **I built that at PriceKeel**, so the research-to-governance loop this role runs is not something I would need to learn on the job.
