

Gold's next growth gain is probably not a new feature. It is a sharper bet on where the acquisition-to-retention funnel is already leaking value. I have closed that exact gap before, on both sides of the funnel, with the numbers to show for it.

A churn program that cut client attrition 50%, an A/B-testing program that cut CPA 25%, and a pricing model that found 50%+ margin hiding inside a system that already ran at scale.

-50% client churn via proactive retention playbooks

-25% CPA across 15+ paid-acquisition A/B tests

+20% conversion from customer-research-driven funnel fixes

50%+ margin lift flagged by a growth-vs-economics pricing model

SwipeHire, a consumer product I owned end to end, UI to funnel

Gold touches nearly every surface in the app. The hard part is not finding a growth idea, it is picking which **funnel stage** to bet on first and proving the trade-off was right.

What that actually requires

A way to size acquisition, trial-to-paid conversion and retention against each other, not just the one metric nearest to the team's current roadmap.

A high-velocity experimentation loop with data science: a hypothesis, a sized test, a scale-or-kill decision, on a cadence fast enough to matter.

Comfort making the growth-versus-unit-economics call on offers and pricing, then defending it with data when a stakeholder pushes back.

What I have already run

At **Pixis**, I cut client churn 50% across an 8-client, \$15K-\$90K/month portfolio through proactive account strategy and vertical playbooks, the retention half of a membership funnel.

At **Plug Power**, I ran 15+ A/B tests across Google Ads, Microsoft Ads, Meta and LinkedIn that cut CPA 25% and lifted conversion 20%, the acquisition and trial-to-paid half.

At **Sensata**, I modeled a BU-wide price-increase system that flagged 50%+ margin gaps, the growth-versus-economics trade-off a Gold offer or price point runs.

The through-line: every funnel stage I have owned had a sized hypothesis and a test behind it, never a feature shipped on a hunch.

What the posting asks for, and where the proof already sits.

What the role covers

- "Decide where to invest across acquisition, trial-to-paid conversion, engagement, and retention... make clear trade-offs between growth, member value, and unit economics."*
- "Partner closely with data science to run high-velocity experiments, and read results with rigor."*
- "4+ years of product management experience, including at least 2 years building consumer-facing products where you owned the end-to-end UI/UX."*

My proof

- Pixis, retention:** cut client churn 50% across an 8-client portfolio through proactive account strategy, feeding voice-of-customer signal directly back into product.
- Plug Power, acquisition and conversion:** ran 15+ A/B tests across paid search and paid social that cut CPA 25% and lifted conversion 20%.
- Sensata, growth-vs-economics trade-offs:** modeled a price-increase system flagging 50%+ profitability gaps, then drove a 12% YoY revenue gain with it.
- SwipeHire, consumer UI/UX ownership:** built an AI job-matching platform zero-to-one, owning entry-point, onboarding and matching-flow decisions for 50+ users.

Size the funnel stage, test the hypothesis, then defend the trade-off with data.

The same three-step pattern on acquisition, retention and pricing: find where the funnel is leaking value, build the smallest test that proves it, then carry the result into a decision the business signs off on.

-50% Churn

Retention Program, Pixis

8-client, \$15K-\$90K/month portfolio; proactive account strategy and vertical playbooks replaced a reactive, one-size response to attrition.

-25% CPA

Acquisition Testing, Plug Power

15+ A/B tests across Google Ads, Microsoft Ads, Meta and LinkedIn against \$100K/month budgets, plus a 20% conversion lift from research-led fixes.

50%+ Flagged

Economics Trade-off, Sensata

A BU-wide Power BI model flagging line items where a configurable change could lift profitability more than 50%, driving a 12% YoY revenue gain.

None of this sat in a slide deck. Each case closed the loop from a sized hypothesis to a number the business signed off on.

What the first month owning a piece of the Gold growth funnel looks like.

WEEK 1

Map the funnel stage by stage and find where value is leaking

Pull discovery, trial-start, trial-to-paid and churn rates by entry point, and flag the one or two stages where the drop-off is largest relative to the opportunity.

Why first: the same first move behind the Pixis churn program and the Sensata pricing model, find the gap before building a test to close it.

WEEK 2-3

Design and ship the first experiment with data science

Pick the highest-leverage funnel stage, size the opportunity, and design an A/B test with data science covering entry point, paywall or onboarding copy and UI.

Why now: the same hypothesis-to-test loop behind the 15+ A/B tests at Plug Power, run with a partner team, not solo.

WEEK 4

Read results, make the growth-vs-economics call, and write the plan

Decide whether the test scales or dies, weigh it against offer and pricing economics, and bring engineering, design and finance along with the plan.

Why this fast: the same trade-off discipline that carried the Sensata price-increase model to a 12% YoY revenue gain.

CLOSE

Robinhood is hiring someone to find the next leak in the Gold funnel and prove the fix with data. I have run that exact pattern on acquisition, retention and pricing, separately, and I want to run it on one funnel together.

The acquisition and conversion half: **15+ A/B tests cutting CPA 25%** at Plug Power and a **20% conversion lift** from research-led fixes, both tied to a business number, not a vanity metric.

The retention and economics half: **50% churn cut** at Pixis and a **pricing model flagging 50%+ margin** at Sensata, the exact growth-versus-unit-economics trade-off a Gold offer runs.
