

PITCH DECK | META PRODUCT MARKETING MANAGER, GENERATIVE AI

The Meta Model API needs a product marketer who can turn developer and business feedback into go-to-market before Product has to guess. I have already run that loop, twice, on buyers who read a spec sheet for a living.

Market assessment, positioning tested against a technical buyer, enablement the sellers actually use, and AI built into how the work gets done.

\$2M+ first-year revenue on a GTM story built from technical specs at Sensata

+30% win rate from sales enablement built for 50+ reps

30+ buyer interviews used to test and iterate messaging before launch

AI agents built on Claude automating my own recurring analysis at Applied Materials

Market view with Sales, Engineering and Accounts so positioning starts from one shared read

The role is not "write the positioning." It is turning AI developer and business feedback into a go-to-market plan **a technical buyer and an internal product team will both trust.**

What that actually requires

A developer evaluating the Meta Model API does not buy a feature list. The market assessment and positioning have to survive a reviewer who already knows the model landscape, not just win a procurement conversation.

Representing market requirements internally to Product, Engineering and Research only works when the marketer has already turned raw technical and field signal into one coherent view, not a slide of anecdotes.

Go-to-market activations have to move fast across sales and partnership teams while the underlying model portfolio itself keeps shipping.

What I have already run

At **Sensata**, I turned deeply technical specs for new sensing products into a GTM and positioning story that OEM and distributor engineers acted on, driving \$2M+ in first-year revenue.

At **Applied Materials** today, I turn field and technical input from Sales, Engineering and Accounts into one market view that shapes pricing and forecasting, the same internal-representation work this role asks for.

At **Applied Materials**, I also automate my own recurring market-sizing and competitive analysis with AI agents built on Claude, the exact AI fluency this posting's preferred qualifications call out.

The through-line: every market view and every positioning story I have shipped had to survive contact with a technical buyer and an internal product team at the same time, and AI is already how I keep that view current.

What the posting asks for, and where the proof already sits.

What the role covers

"Lead market assessment... represent the requirements of the market internally with Product, Engineering, and Research."

"Own go-to-market strategy... guiding cross-functional teams in developing communications, product documentation, and positioning."

"Demonstrated ability to integrate AI tools to optimize workflows and drive measurable impact."

My proof

Applied Materials, market view for Product and Engineering: turns field and technical input from Sales, Engineering and Accounts into one market view that shapes pricing and product decisions.

Sensata, GTM to \$2M+ revenue: owned go-to-market and positioning for new sensing products across North America and Europe, cross-functional from day one.

Sensata, 30+ buyer interviews and 50+ reps enabled: tested messaging directly with OEM and distributor engineers, then armed sellers with the materials that moved win rates 30%.

Applied Materials, AI agents on Claude: automates recurring market-sizing and competitive analysis, the measurable-impact AI fluency this role's preferred qualifications ask for.

Own the market view, arm the sellers, then **keep testing the message against the toughest buyer in the room.**

Same pattern across two roles: translate technical and field signal into one market view, put it in front of the people carrying the launch, then measure whether it moved a number.

\$2M+

First-Year Revenue, New Sensing Products

GTM, positioning and messaging built from technical specs for OEM and distributor engineers across North America and Europe, plus a 15% conversion lift on priority launches.

+30% Win Rate

Cross-Functional Sales Enablement

Presentations, case studies and technical content built for 50+ reps carrying live technical deals, backed with direct product depth.

30+ Interviews

Message Testing With Technical Buyers

Structured interviews with OEM and distributor engineers that tested and iterated messaging before it shipped, lifting CSAT 22% on the accounts that gave feedback.

The common thread: none of these were a positioning doc that sat in a folder. Each one closed the loop from market signal to a number Sales, Product or the technical buyer was accountable for.

What the first month owning product marketing for the Meta Model API looks like.

WEEK 1

Sit inside the developer and business feedback loop

Pull the last 10-15 developer and business conversations about the Meta Model API, and map where current positioning and documentation do and do not survive a technical reviewer's questions.

Why first: the same first move behind the Sensata GTM work, listening to where the message breaks before rewriting it.

WEEK 2-3

Rebuild one market view with Product, Engineering and Research

Pick the product or solution where technical depth and buyer-facing narrative sit furthest apart, and rebuild its positioning and go-to-market plan together with the teams that own it.

Why now: the same cross-functional build that moved Sensata's win rate 30% instead of shipping a deck no one used.

WEEK 4

Stand up the AI-assisted market-intelligence loop

Build the first agent or automation that removes a manual step from turning competitive and industry-trend research into an internal market brief, and run it against a live decision so the win is measured.

Why this fast: the same habit that keeps my own market-sizing moving at Applied Materials today, not a plan for someday.

CLOSE

You are hiring someone to turn developer and business feedback into a market view that Product, Engineering and Research will actually act on. I have already run that pattern, twice.

The core proof is one Sensata arc: **\$2M+ first-year revenue** from GTM and positioning built out of deeply technical specs, then **+30% win rate** once that story was armed with sales enablement for 50+ reps.

What is harder to find is someone who has already made AI load-bearing in their own market work, not a line item. At Applied Materials I automate my own market-sizing and competitive analysis with agents built on Claude, because rebuilding the same report every cycle is time that should go into the next launch.
