Hiring Team, Ripple

Your posting describes this role as the analytical backbone of the growth marketing engine, owning measurement from campaign to pipeline attribution. I built the closest thing to that at Sensata: a Power BI system tracking 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, regional scorecards, win rate and stage distribution that surfaced \$433M in margin gaps for leadership to act on. The underlying skill is the same one your team needs: turn spend and deal data no one has fully reconciled into a dashboard executives trust on sight.

The posting also asks for someone who ensures data quality and integrity across CRM and marketing systems while partnering with RevOps and Finance on forecasting and budget decisions. That is the operating model I run daily at PriceKeel, the company I founded: I set up the CRM and CPQ myself, run the forecast and pipeline reviews, and built the audit trail that gives Finance one record it can check without asking me first. Running the system end to end, not just reporting on it, is why I notice the data-quality gaps most dashboards paper over.

AI-powered tools are not new to how I work either. At Applied Materials I automate recurring forecasting and pricing analysis with agents built on Claude, cutting the manual reporting time that otherwise eats into the hours a team should spend on the insight itself. That is the same instinct behind using AI and machine learning to improve attribution accuracy and scalability rather than treating it as a dashboard add-on.

On attribution specifically: at Pixis I ran Amplitude and Tableau against user behavior across 30 plus campaigns, using incrementality reads to separate paid lift from organic baseline, which lifted campaign ROAS 40 percent. That same discipline, isolating what spend actually caused versus what would have happened anyway, is what your posting calls lift analysis, and it is where I would start on Ripple's own attribution models. Proof trail at adhi-growth-ai.vercel.app/ref/ripple.
