Hiring Team, Glean

The 100+ feature backlog I owned at Sensata only worked because I sat with Engineering on every spec, not after the fact. That is the muscle your API Platform req is really asking for: someone who can sit across the table from the people writing the contracts and the people consuming them, and keep both honest about tradeoffs.

Most of my product experience lives on the integration side rather than inside an SDK repo, and I think that is useful here. I rebuilt the Mar-Tech stack at Plug Power end to end, Salesforce, Adobe Analytics, GA and Google Tag Manager wired for closed-loop reporting, and I ran 30+ interviews with OEM and distributor engineers at Sensata to find exactly where their integration broke down before shipping fixes that raised CSAT 22% and feature adoption 18% across 50,000+ connected devices. That is the same job as reading support tickets and turning them into a cleaner API surface, just on a different stack.

I am also comfortable being the translator. I turned Sensata's technical specs into documentation and positioning that customers could actually act on, lifting conversion 15% on priority launches, and at Applied Materials I build my own Claude AI agents to automate the repetitive side of forecasting, so I already think in terms of what should be self-serve versus what still needs a human read. For a developer-facing product, that is the same judgment call as abstraction versus escape hatch.

I like that this role is as much about the error message a developer sees at 2am as it is about the roadmap. Proof trail at adhi-product-ai.vercel.app/ref/glean.
