Hiring Team, Zee Labs

Your posting says this role isn't suitable for someone who prefers a defined daily task list, and that's the part that made me want to write this instead of just applying. At PriceKeel, the company I founded, there was no task list: I designed the guardrail engine, built the audit trail Finance now checks a pricing decision against, and set up the company's CRM, CPQ and deal-approval process from zero. Nobody handed me a spec for any of it. That is the kind of ground-up technology ownership your "internal technology stack" line is asking for.

The AI side of this role is already how I work day to day. At Applied Materials I automate repetitive market analysis with AI agents built on Claude, and the habit goes back further: I built an AI job-matching platform called SwipeHire from zero, writing the PRD, scoping the MVP and shipping it in Python, OpenAI API and React without a dedicated engineering team behind me. That is the product-and-engineering range your posting describes without requiring someone who codes full time.

I have also sat inside the creative and cross-functional side of this, not just the technical side. At Pixis I hired and managed an eight-person team running eight client accounts, and when a fashion client's funnel stalled, I rebuilt it end to end with a full creative refresh alongside the media buy for 3x ROAS in a single month. Creative and performance work only move together when the person running them treats both as one problem, which is how I'd approach collaborating with your design, engineering and creative teams.

What I'd bring on day one is a habit of picking up whatever is actually blocking the work, technical or creative, and owning it through to a result, plus the AI-native instincts to automate the repeatable parts of that along the way. Proof trail at adhithyabhaskar.vercel.app/ref/zee-labs.
