Hiring Team, Ciena

Competitive benchmarking across 10+ players turned into a 12% revenue lift and an 8-point market-share gain at Sensata, not a slide deck nobody acted on. That is the discipline I would bring to Ciena's view of the inside-the-data-center landscape: AI cluster architectures, coherent optics, pluggable optics, scale-up and scale-out networks, and the rest of the technologies your competitors are racing to ship next.

At Applied Materials I size the semiconductor market in partnership with Sales, Engineering and Accounts, turning technical input from people closer to the hardware than I am into one forecast the business can plan against. I automate the recurring research and briefing work behind that with AI agents built on Claude, which is the same habit your posting names for content development, not a tool I would need to pick up on day one.

I led a 5-consultant team on a pro-bono engagement for Safran that took 170 facilities down to a defensible SAM of 28 and benchmarked 10+ competitors to assess market-entry feasibility, then presented the recommendation directly to Safran's leadership. That is the same muscle this seat needs: pull technical and market signal from Sales, Marketing, PLM, the CTO office and R&D, and turn it into a briefing a non-technical stakeholder can act on before a competitor's move lands.

I would like to bring that combination, competitive benchmarking tied to a business outcome and AI tooling as a daily habit, to Ciena's competitive-intelligence seat on inside-the-data-center technologies. Proof trail at adhithyabhaskar.vercel.app/ref/ciena.
