Hiring Team, Marketing & Business Development, Applied Materials

Most market analysis assumes hundreds of buyers and a fragmented competitive set. Semiconductor equipment is the opposite. Five customers (Intel, TSMC, Samsung, plus a small tail) drive most of the demand. Four competitors (LAM, TEL, KLA, ASML for litho) define the competitive frame. That changes the craft. You are not running surveys to estimate demand from populations. You are modeling specific customer capex cycles, building forecasts at the contract and tool level, and stress-testing your own roadmap against four to five named competitors whose moves you can name in advance.

That concentrated-customer, concentrated-competitor analysis is the kind of work I have already been doing in industrial B2B, just one industry over.

At Sensata I lead global pricing for the Industrial BU. The customer set is concentrated: a defined number of OEMs and distributors per region, each with multi-year supply agreements. I built 3-scenario pricing models with sensitivity analysis for AP26 planning, presented to senior executives, contributing to +12% YoY revenue and +8% market share. The work was not extrapolating from population data. It was modeling specific account-level scenarios and pressure-testing them against competitor moves I could name.

Three other proof points that map directly to your JD:

Pricing and margin analytics at scale. I built a 4-page Power BI dashboard, "Bleeders and Leakers," analyzing 1,200 pricing opportunities worth \$627M across 3 regions, 4 product families, and 20 product lines. The KPI framework exposed \$433M in margin gaps and informed leadership prioritization down to the salesperson and product line. This is the same shape as the product financial plans your JD asks for.

Competitive benchmarking on small named competitor sets. At Sensata I ran competitive analysis on 10+ industrial-sensor players to identify pricing and feature gaps that informed AP26. At Plug Power I benchmarked hydrogen-energy market players (Cummins, Ballard Power, Bloom Energy) and B2B engineering personas, surfacing positioning gaps that informed channel and content strategy. Both engagements were deep on a small set, not shallow on a long tail.

Market sizing on concentrated B2B accounts. I led a Simon pro-bono consulting team for Safran (B2B aerospace and defense): TAM and SAM across 170 facilities, ending with a SAM of 28, plus 4-vertical persona work and positioning for 3 product lines, presented to Safran leadership. Same model: small named market, deep per-account analysis.

Honest note: I have not worked in semiconductor equipment specifically. I would expect the first 30 days to be deep on Applied Materials' product portfolio, fab customer base, and competitive positioning before I propose anything. My BE in Mechanical Engineering (BITS Pilani) and MS in Marketing Analytics (Simon, U. of Rochester, Dec 2024) plus Python, SQL, Power BI, and Tableau as daily workflow give me the technical footing to ramp fast.

Boston-based, open to relocating to Santa Clara. Resume and portfolio: adhityabhaskar.vercel.app/ref/applied-materials

Would love 15 to 20 minutes to hear what the team's hardest "we got the forecast wrong" problem looks like right now.
