VP of Growth Marketing, Garner Health

Most growth marketers know how to run experiments. Fewer know how to build the system that runs experiments at volume without the team becoming the bottleneck. The difference between 5 A/B tests a month and 50 is not effort. It is automation infrastructure: templated variants, programmatic segmentation, trigger-based deployment, and AI-augmented content that lets one person do the work of three without sacrificing quality. Your JD explicitly asks for someone who can "create AI tools for campaign optimization." I built one.

SwipeHire is a production AI tool I built this year using the OpenAI API in Python. Not a ChatGPT wrapper. End-to-end: prompt engineering, structured output parsing, automated content generation pipelines. I instrumented the full growth stack (GA4, GTM, event tracking, cohort dashboards) before launch, ran 8+ A/B tests on activation flows across email and landing pages, and lifted activation 25%. I hold four Anthropic Claude certifications. When the JD says "develop growth tech stack and create AI tools," that is a description of work I have already shipped.

Three other things from the JD that map directly:

Lifecycle automation from scratch. At Plug Power I built HubSpot email automation, trigger-based workflows, segmentation logic, and personalized nurture sequences for B2B buyers. Configured every cadence, A/B tested messaging and timing, built closed-loop attribution via Salesforce + Adobe Analytics. -25% CPA, +20% conversion. The infrastructure did not exist before I arrived. I built it, then optimized on top of it.

High-volume experimentation across channels. At Pixis I ran weekly optimization cycles across Meta, Google, and programmatic for 8 global B2C and e-commerce clients on a \$1.4M budget. Creative A/B testing, audience variants, bidding experiments, holdout incrementality. Client churn dropped 50% because the experimentation cadence was tight, not because the strategy was clever. At GenY I delivered 16x ROAS through seasonal promotion experiments across Shopping, Advantage+, and catalog A/B tests.

Cross-functional growth in a product-led org. At Sensata I managed a 100+ feature backlog in Agile across Product, Engineering, and regional teams. Built the experimentation and measurement framework on 50K+ connected devices. Coordinated with Data and Analytics on segmentation and targeting. That cross-functional seat between Product, Eng, and Data is where your JD places this role, and it is where I have operated for 18 months.

MS Marketing Analytics (Simon, U. of Rochester). Open to NYC, 3 days in-office works.

Resume and portfolio: adhithyabhaskar.vercel.app/ref/garner

Would love 15 to 20 minutes to hear what the growth team's current experimentation velocity looks like and where the AI-tooling gap is.
