Hiring Team, Go-to-Market — Skydio

Hardware GTM enablement is structurally different from SaaS enablement, and most orgs miss it. SaaS reps win by being good at the demo. Hardware reps win when the customer's first deploy actually works in the field — which means enablement has to bridge from sales pitch to first successful mission. The gap between "they signed the order" and "the chief actually flew it on a barricade response" is where deals stall, contracts churn, and reference customers fail to materialize. The good enablement orgs build for that bridge from day one. The bad ones build a battlecard and call it done.

That's the part of GTM Enablement I want to work on, and it lines up with what I've actually done.

At Sensata I ran enablement for industrial-sensor sales into OEMs, distributors, and engineering buyers. The product is hardware. The buyers care about spec compatibility, integration, and how fast their team can get something into production. I did **30+ field interviews** with reps and partners to figure out where deals were actually getting stuck (it was rarely where Sales said). Then I co-built decks, battlecards, and case studies with the people who'd use them — **50+ reps** across NA and EU. **Partner win rates went up 30%**. The content worked because reps had drafted it. And because we measured adoption (read time, share rate, attach rate to closed-won deals) instead of guessing.

Three other things that map directly to your JD:

Cross-functional program management at scale. I ran a 100+ feature backlog in Agile across product, engineering, and 3 regional teams — user stories, acceptance criteria, dependency maps, release coordination. Cut TTM 20%. The hardest part of enablement coordination isn't writing the playbook; it's keeping Sales, Partnerships, and Marketing aligned on what "ready to ship" actually means.

Adoption analytics that change behavior. At Sensata I built a SQL + GA4 framework on 50K+ connected devices and put it on a monthly review cadence with product and engineering. Feature adoption lifted 18%. Dashboards leadership doesn't use don't matter — the unlock is building review cadence into the rollout, not just instrumentation.

Founder mode. I built SwipeHire from zero this year — instrumented funnel before launch, ran 8+ A/B tests on activation, +25% lift, 50+ users. The hardest part wasn't shipping; it was deciding what to ignore when there's no PRD inbox. Same prioritization muscle that "fast-moving environment with motivation toward operational excellence" describes in your JD.

One thing worth knowing: my undergrad is a BE in Mechanical Engineering (BITS Pilani). I can read hardware specs, talk with engineers in their language, and reason about the operational reality of deploying physical product — not translate it through a marketing filter.

Open to relocating to San Mateo for the hybrid schedule. Resume + portfolio: adhithyabhaskar.vercel.app/ref/skydio

Would love 15-20 minutes to hear what the team's biggest first-deploy bottleneck looks like right now — or if it's a different problem entirely, what it actually is.
