Hiring Team, Growth Marketing, Ramp

Website CRO is the cheapest growth lever most companies never fully pull. Not because teams lack ideas, but because the loop is usually broken: hypotheses live in one person's head, instrumentation leaks, results take three weeks to read, and the team that shipped the test is already onto the next thing. The growth manager who moves the number is the one who treats the experimentation loop as a product with its own SLA, its own analytics, and its own AI-augmented variant pipeline.

I have built that loop three times.

I ship AI-augmented experiments, not slideware. I founded SwipeHire, a production AI product on OpenAI API + React. I wrote the resume-tailoring pipeline, built the GA4 + GTM + event tracking stack around it, and ran 8+ sequential A/B tests on landing and onboarding that lifted activation 25%. I use Claude to draft-and-critique variants (separate calls for draft and judge, human gate on ship), which is the non-obvious piece most teams miss. I hold Claude Cowork, Building with the Claude API, Claude Code, and Claude 101 certifications.

I have run growth for an AI SaaS at scale. At Pixis I operated on an AI adtech platform managing \$1.4M across 8 enterprise D2C and e-commerce clients. Weekly experimentation cycles on Google, Meta, and programmatic. 3x ROAS in 30 days for a leading fashion brand through feed cleanup, smart bidding, creative A/B tests, and lookalikes. Client churn down 50%.

I have rebuilt a lead-gen website and MarTech stack from scratch. At Plug Power I owned CRO and Paid Search/Social for a B2B audience and built the Salesforce + Adobe Analytics + GA + GTM stack with closed-loop attribution from ad click to SQL. A/B testing on landing pages, match types, and creatives delivered -25% CPA and +20% conversion.

Three specific points from the JD that line up:

Own the testing feedback loop. I treat experimentation as product: a backlog with prioritization, pre-registered hypotheses, power calculations, and a kill-by date. SwipeHire has a public-facing A/B test log I'll happily walk through in interview.

AI-powered workflows for experimentation and reporting. My default stack is Claude for variant generation + quant gate, Zapier for routing, GA4 + SQL for measurement, and Looker Studio / Power BI for reporting. The unlimited AI tokens benefit was not a nice-to-have for me; it is how I actually work.

Cross-functional translation. BE Mechanical Engineering (BITS Pilani) + MS Marketing Analytics (Simon, Rochester) + four years at Sensata, Plug Power, Pixis, and SwipeHire means I can read an eng spec, a CFO deck, and a product PRD in the same afternoon. The JD calls this "dissect complex problems, identify solutions, drive to completion"; I call it Tuesday.

Committed to relocating to New York.

Resume and portfolio: adhithyabhaskar.vercel.app/ref/ramp

Would love 20 minutes to hear where the funnel currently leaks and what the first three tests should be.
