Hiring Team, Reevo

Four months ago I started building PriceKeel: a decision-integrity layer for B2B SaaS deal pricing. It reads a live discount exception inside the deal platform, recommends an explainable guardrail learned from that company's own closed-won and closed-lost history, and records the human decision with evidence Finance can audit later. I did not set out to build a Reevo-adjacent product. I got there because I kept running into the same thing you built the company around: the revenue stack asks reps to make consequential calls inside tools that hold no memory of what actually closed. Reading the Product Marketing Lead JD felt like reading the second half of an argument I have been making to myself since May.

That overlap matters for the positioning work more than it does as a resume line. The hard narrative problem for an AI-native revenue OS is not proving the model is smart. It is answering the two questions a VP of Sales asks in minute four: will my reps actually use this, and can I defend what it recommended when the number is wrong. I have had to answer both in writing, for my own buyers, every week since May. I have also had to answer them for someone else's product. At Pixis I drove adoption of an AI decisioning platform inside eight enterprise revenue teams and cut book churn 50 percent, which taught me exactly where AI recommendations get trusted and where reps quietly route around them.

The core PMM engine is what I did at Sensata for close to two years. I owned positioning and messaging for industrial sensor lines and turned dense technical specs into value propositions that lifted conversion 15 percent. I built the sales enablement system for 50-plus reps (pitch decks, demo narratives, battlecards, ROI narratives, objection handling) tied to a 30 percent lift in win rates. I ran 30-plus structured customer interviews and paired them with SQL and GA4 usage data across 50,000-plus devices, which fed a 100-plus feature backlog with engineering and raised feature adoption 18 percent. End-to-end GTM across NA and EU delivered 2 million dollars-plus in first-year revenue and 35 percent more qualified leads. That is the ideation-through-adoption loop your JD describes, run at a company where nothing shipped unless sales could carry the story into the room.

On the growth and web side, Plug Power is the proof. I rebuilt the web and MarTech stack from zero on Salesforce, Adobe Analytics, GA4, and GTM: UTM spec written from scratch, landing-page architecture, CTA and creative testing, form-to-CRM sync. CPA fell 25 percent and conversion rose 20 percent, and marketing and sales ended up with one shared definition of pipeline quality instead of two competing dashboards. On the AI-tooling side I hold four Anthropic Claude certifications, run Claude and Cursor daily, and ship against the Claude and OpenAI APIs in production, so building repeatable GTM playbooks that automate the routine parts is how I already work rather than something I would need to learn on your time.

Five days a week in San Francisco or Santa Clara works, and I am ready to relocate from Boston for it. Full proof trail at adhi-product-ai.vercel.app/ref/reevo.
