Hiring Team, WHOOP

Growth marketing analytics splits into two skill stacks that rarely sit in the same person. One stack is the measurement craft: SQL on warehouse data, attribution rebuilds across Salesforce and Adobe and GA4, holdout incrementality tests that survive a CFO's pushback, dashboards that work as well for a pacing meeting as for a quarterly review. The other stack is AI fluency that goes past prompting - APIs called from production code, eval loops that the team trusts, workflows where Claude or GPT is structural rather than decorative. WHOOP's JD asks for both. That convergence is what I've been building toward.

The consumer-attribution muscle is closest at Pixis. I ran an 8-client D2C portfolio (beauty, fashion, e-commerce) with per-client monthly media budgets between \$15K and \$90K across Google, Meta, Criteo retail-media, Amazon Ads, and programmatic. The work that maps cleanest to this role was the attribution restructure I led for a leading beauty brand: blended ROAS looked acceptable, but a closer read showed two channels were getting credit they hadn't earned. I reallocated spend based on true lift, validated through holdout incrementality, and the brand cleared 3x ROAS in one month. That is the "translate complex data into decisions that inform budget allocation" line in the JD, in a consumer DTC context, with a real beauty-brand outcome attached.

The closed-loop attribution rebuild happened at Plug Power. I owned multi-channel paid acquisition across Google Ads, LinkedIn, Meta, and Adobe-driven programmatic. CPA fell 25% and conversion rate rose 20%, but the work I would point to for this role is the infrastructure underneath: UTM spec written from zero, GTM containers rebuilt, GA4 events validated end-to-end, lead routing run through Salesforce campaign attribution, the loop from ad click to SQL traced and proven. The "experimentation and measurement efforts including incrementality testing and platform lift studies" mandate in the JD is the literal description of that work.

The dashboards-at-scale and stakeholder-translation muscle is Sensata. I designed a \$627M margin-recovery executive Power BI dashboard tracking 1,200 opportunities across 3 regions, 4 product families, and 20 product lines. KPI frameworks (% to target, win rate, average \$/win, pipeline stage distribution) and regional deep-dives that let leadership identify \$433M in margin gaps. The dashboard was read by a CFO and acted on the same week. "Influence stakeholders through clear storytelling and data visualization" is what that work was.

On AI-tool fluency, I hold four Anthropic Claude certifications (Claude 101, Claude Code 101, Cowork, Building with Claude API) and run prompt-based iteration as my daily workflow in Cursor. I shipped the NSE Paper-Trading Bot solo on Python with the Claude API as a reasoning layer for news and catalyst analysis on top of a rule-based scoring engine - a production analytics product, not a prototype. SwipeHire is a second shipped product on Python, OpenAI API, and React, with GA4 + GTM + Amplitude instrumented day-one and 8 A/B tests against activation flows.

Boston-based, no relocation needed. Resume attached. Pitch deck mapping these proof points to the JD available on request, or via the portfolio link below.
