Hiring Team, YOOBIC

The JD asks for a builder who can run ABM across 1:1, 1:few, and 1:many tiers with the operator instincts to design intent-trigger programs, route alerts to BDRs and AEs, and own pipeline targets. I've been doing the substance of this work in two adjacent seats, and the AI-builder + test-and-learn bonus criterion is where my profile gets unusual.

At Plug Power, I built the account-level ABM stack from zero on Adobe Audience Manager and LinkedIn ABM. Account-level behavioral segments, retargeting funnels, suppression lists, audience layers by title and seniority and industry. HubSpot lifecycle stages and account-level behavioral segmentation feeding sales-handoff workflows. Closed-loop attribution rebuilt on Salesforce campaign attribution with lead-routing rules and SLA documentation feeding BDR and AE alerting. CPA fell 25%, conversion rose 20%, but the work I would point to for this seat is the orchestration underneath: account-level segments driving multi-channel engagement and the routing logic that made it operate.

At Pixis, I ran an 8-client B2B SaaS portfolio with a \$1.4M aggregate annual media book. Per-client budgets \$15K to \$90K. Each client was effectively an ABM target for the agency - bespoke ICP definition, cross-channel orchestration across Meta, Google, LinkedIn, Criteo, Amazon, and programmatic, weekly client CFO QBRs presenting engagement-to-pipeline conversion. Holdout-incrementality work on one beauty client drove 3x ROAS in a single month. The pattern - tiered accounts, cross-channel orchestration, structured engagement review - is the same as 1:1 / 1:few / 1:many ABM at a B2B SaaS, just framed as agency-side client work.

On the builder side, two shipped AI products solo. SwipeHire on Python + OpenAI API + React, GA4 + GTM + Amplitude wired day one, 8 A/B tests on activation, +25% lift V1 to V2. NSE Paper-Trading Bot on Python + Claude API as an agentic reasoning layer over rule-based scoring. Plus four Anthropic Claude certifications and Cursor + Claude as daily workflow. The "test-and-learn builder" line in the JD is exactly the operator pattern.

On YOOBIC specifically, the frontline-employee-experience category and the global retail/hospitality customer book (300+ brands) are the kind of buying committees where account-level orchestration compounds - one global retailer named on the customer list represents a 12-stakeholder engagement, not a single buyer. That's the muscle I'd be most useful for.

Attaching my resume and a 6-slide pitch deck mapping these proofs to the JD line-by-line, plus three specific ABM ramp experiments I'd run in the first 60 days. Full portfolio is at adhi-growth-ai.vercel.app/ref/yoobic.

Remote works, Boston-based.
