Hiring Team, Monolithic Power Systems

Your posting asks the power modules PMM to price each product primarily on the value of its function for a given application, then carry that logic through to the data sheets and applications materials the field actually uses. I have run that exact loop before: at Sensata I owned the GTM launch for new sensing hardware end to end, positioning, pricing, channel and launch, turning technical specs into customer-facing value language that lifted conversion 15% on our priority launches while the line drove \$2M+ in first-year revenue through a network of OEM and distributor accounts.

The rest of the role reads like a day I have already had: competitive analysis feeding roadmap and launch decisions, direct engagement with field sales and customers, and being the person who can turn a technical question from an applications engineer into an answer a buyer will act on. I interviewed 30+ OEM and distributor stakeholders at Sensata to surface real pain points, ran ongoing competitive analysis across EMEA and the US, and built the sales enablement decks and case studies that 50+ reps used to close, which took win rates up 30%.

I am now Strategic Marketing III at Applied Materials, sizing the semiconductor market with Sales and Engineering and building competitive, value-based pricing across multiple product groups, the same forecasting a power module needs before it reaches a customer's design cycle. I have also started running AI agents built on Claude on the repetitive side of that analysis, which frees up more of the week for the customer-facing part of the job.

Pricing depth is where I would add the most immediately: as Pricing Lead at Sensata I sat with senior executives on multimillion-dollar customer quotes and repriced distribution, raising channel-partner margins from 53% to 61% in under two quarters. That is the discipline I would bring to pricing power modules on function, not formula. Proof trail at adhi-product.vercel.app/ref/monolithic-power-systems.
