Hiring Team, Perplexity

Your posting asks for a PM who turns a recurring internal or customer need into one shared service instead of a one-off fix each time it comes up, and that is the exact problem I solved before anyone funded a team to help me with it. I built SwipeHire's matching logic with its own evaluation checks and safeguards designed in from the start, not bolted on after a bad match slipped through, and shipped the whole thing alone (Python, OpenAI API, React) to 50+ early users. That is the "AI-native" habit your posting is describing: the guardrail is part of the product, not a review step someone adds later.

Serving stakeholders with genuinely competing priorities is the other half of this role, and I have run that exact tension at scale. At Sensata I owned the roadmap for a sensor product line end to end: a 100+ feature backlog managed with Engineering in Agile across three regions, each with its own release calendar and none of them willing to wait for the others. At Applied Materials now, I pull together market and pricing input from Sales, Engineering and Accounts into one shared view instead of three separate ones, because three versions of the truth is worse than one version everyone has to compromise on.

Defining a metric before a clean answer exists is where I spend most of my actual judgment. At Sensata, no shared definition of adoption existed across 50K+ connected industrial devices, so I built the KPI framework in SQL and GA4 myself, picked the cohorts that signaled real intent, and used that to lift feature adoption 18%. I would rather own that ambiguity early and be wrong once than wait for someone else to hand me a clean metric that does not actually answer the question.

I would like to talk about which recurring need at Perplexity is the highest-leverage shared service to build first. Proof trail at adhi-product-ai.vercel.app/ref/perplexity.
