Hiring Team, OLake

More people star a repo than run it, and the fix for that is not another blog post that says "fast" without a benchmark behind it. I write for buyers who check claims before they believe them. At PriceKeel, the company I founded, RevOps and Finance teams audit every pricing decision against their own closed-won and closed-lost data before they trust the guardrail engine behind it. Making a case that holds up to that kind of scrutiny is the same job OLake needs for engineers who read benchmarks and check the repo before they install anything.

At Sensata I built KPI frameworks in SQL and GA4 across 50,000-plus connected industrial devices to find which cohorts were actually adopting a new feature, not just clicking into it, and ran 30-plus customer interviews with the OEMs and distributors who had to trust the sensor data before they shipped on it. At Plug Power I owned the content and SEO work directly: raised organic search visibility 35% by closing real keyword-strategy gaps, then automated the lead flow end to end so the time saved went back into writing instead of chasing data. That is the same loop a content calendar for data engineers needs: write something worth bookmarking, then use the analytics stack to prove which piece actually moved someone from a star to a user.

I have hired and managed teams end to end, from an 8-person account team at Pixis carrying its own P&L to the team behind SwipeHire, a job-matching platform I shipped zero to one with its own GTM analytics stack and OKR cadence. Running a small team through short OKR cycles while still writing and shipping content myself is not a new shape of work for me, it is the one I have been doing.

Proof trail at adhi-growth-ai.vercel.app/ref/olake.
