Hiring Team, Affirm

Your posting for the Senior Product Manager, Credit & Pricing asks for someone who ships new pricing features for the merchant portfolio and can show the measurable impact after. That is the exact loop I ran at Sensata as Pricing Lead. I built a Power BI system that scored 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, surfaced \$433M in margin gaps, and then closed \$700K+ of them in two quarters by negotiating fixes built on competitive gaps and documented customer willingness to pay. Distributor and channel-partner margins moved from 53% to 61% because the repriced deal structures held past the first quarter, not because of a one-time policy change.

I run the same build-and-measure loop today at PriceKeel, where I'm the founder. It reads a live discount exception the moment a rep requests one and recommends an explainable guardrail learned from a company's own closed-won and closed-lost deals, with an audit trail Finance can point to behind every call. That is close to what "creating new products and features for merchant financing offerings" actually requires: a feature that changes a real pricing decision, plus a way to prove afterward that the change worked. I also carry the analytical habit your posting asks for directly. I use SQL, Power BI and regression to find where a portfolio is bleeding margin before proposing a fix, not after.

Credit and pricing decisions do not sit with one team, and I have not gotten to build one in isolation either. At Sensata I partnered with senior executives on AP26 revenue models and multimillion-dollar customer quotes; the deal structures I proposed had to clear Finance, Sales and the executives who owned the accounts before they shipped. At Applied Materials I build competitive, value-based pricing for a fast-growing market and forecast its inflection points with Sales, Engineering and Accounts in the room, and I keep automating the recurring parts of that analysis with Claude AI agents so the actual thinking gets more time, not less.

Affirm's merchant portfolio is exactly the kind of surface where a pricing change either compounds or backfires depending on how well it's measured. I'd bring the same pattern that held at Sensata: build the feature, ship the guardrail, and go back and check whether the number actually moved. Proof trail: adhi-product-ai.vercel.app/ref/affirm
