Hiring Team, DoorDash

Your posting describes the Pricing & Affordability team's mission as making DoorDash the smartest, most affordable place to shop, and asks the person in this seat to read the full P&L, order data and pricing data to find where fee structure can move without losing the business. I spent the last year doing that exact search inside a much larger, messier dataset: 1,200 pricing opportunities against a $627M target at Sensata, most of them untracked until I built the model that found them.

That model, Sensata's Bleeders and Leakers program, surfaced $433M in margin gaps and turned into $700K+ recovered in two quarters once I ran the negotiations it pointed to. I used the same lens on the channel side: distributor and partner margins were stuck at 53%, and repricing the parts sold through distribution, backed by competitive benchmarking against 10+ players, moved them to 61% in under two quarters while adding 12% YoY revenue. Fee and margin design rarely fail from a lack of data; they fail because nobody built the model that turns the data into a decision. That is the gap I close.

The forecasting and Finance-partnership side of this role is also familiar ground. At Applied Materials I build the forecasting and market-sizing models that carry P&L and revenue targets across product groups, and I automate the repetitive parts of that work with AI agents built on Claude so more hours go to the judgment calls a model cannot make, the same builder's mindset your posting asks for with Claude and Cursor. At PriceKeel, the B2B pricing company I founded, I run CRM, CPQ, forecast reviews and deal approvals myself and keep an audit trail Finance can read, so I know what "evidence-backed pricing decision" has to look like end to end, not just from the analyst's side of the table.

I would like to talk about which fee or affordability lever is next on the roadmap and where the current model for it breaks down. More of the work is at adhithyabhaskar.vercel.app/ref/doordash.
