Hiring Team, Pilotbase

Your posting asks for someone to own the approved claims and message architecture that both the team and its AI workflows draw from. At Sensata, I built exactly that kind of trusted foundation for a new sensing product line: positioning, pricing and launch narrative built from 30+ customer interviews, then codified into the claims and case studies 50+ reps used in the field. That program drove $2M+ in first-year revenue and a 15% lift in conversion on priority launches.

You are also asking this person to track a shifting competitive landscape across EFB, logbook and ground school, and turn it into decisions that touch product, pricing and GTM at once. I ran that same loop at Sensata across a 4-product-family, 20-product-line portfolio, tracking competitor moves across EMEA and the US and feeding the findings straight into win/loss reviews, positioning and launch hypotheses. Carrying a multi-product story, where LogTen's trust and Pilotbase Pilot's growth both need defending in the same breath, is a familiar shape of problem for me.

Subscription and pricing research is the other piece. I modeled three subscription pricing tiers for SwipeHire, my own AI job-matching product, from competitor benchmarks and willingness-to-pay signals, and I use AI daily at Applied Materials to automate the recurring market and competitive analysis that used to eat a research cycle. Scaling research with AI, while keeping judgment about where not to trust it, is how I already work, not a new habit I would need to build for this role.

What I would bring to Pilotbase is a product marketer who has already run this loop end to end: positioning built on real research, defended with approved claims, tested against win/loss and subscription data, and scaled with AI rather than slowed down by it. Proof trail at adhi-product-ai.vercel.app/ref/pilotbase.
