Hiring Team, Databricks

I built an AI product from a blank page before I ever had a "Product Manager" title to put on it. SwipeHire started as an idea for an AI job-matching platform; I wrote the PRD, scoped the MVP on the OpenAI API, and shipped auto-tailored resumes and profile-based job matching to 50+ early users. That is the same arc your posting describes for Databricks AI: take a capability that engineering and research are advancing and turn it into a product a customer can actually use, concept to launch.

The roadmap muscle behind that comes from Sensata, where I owned the product roadmap and a 100+ feature backlog for sensor solutions in automotive and industrial segments, working with engineering in Agile across 3 regions to release 25% faster and cut time-to-market 20%. None of those calls were made from a dashboard at a distance. I ran 30+ structured interviews with OEMs and distributors to find the use cases worth building next, then built the SQL and GA4 KPI frameworks across 50K+ connected devices that told us whether a launch actually landed.

I read the Databricks AI mandate as needing both halves at once: enough technical fluency to sit with engineering and research on what is actually buildable, and enough customer time to know which agent or model capability is worth shipping first. At Applied Materials today I size markets with Engineering, Sales and Accounts and build the forecasting models that keep pricing ahead of a fast-moving technical roadmap, which is the enterprise-SaaS discipline behind "shipping in competitive markets" that the role asks for.

I also build my own AI agents on Claude to cut the repetitive parts of that analysis, so the habit of turning an AI capability into a working tool is not new to me, it is how I already do my own job. The proof trail, including the SwipeHire PRD and build notes, is at adhi-product-ai.vercel.app/ref/databricks.
