PITCH DECK | DATABRICKS SR. PRODUCT MANAGER, DATABRICKS AI

Enterprise generative AI moves faster than most roadmaps can absorb it. The hard part is not the model advance, it is turning that advance into a product a customer will trust with real workflows before the window closes. I have already run that exact loop, twice.

One AI product built zero-to-one on an LLM API, and one enterprise roadmap shipped 25% faster with the same customer-engaged discipline.

- **Zero-to-one AI build** on the OpenAI API: PRD to 50+ shipped users
- **100+ item roadmap** shipped 25% faster across 3 regions in Agile
- **30+ customer interviews** turned into new-use-case roadmap calls
- **SQL + GA4 KPI frameworks** across 50K+ connected devices
- **AI agents built on Claude** automating my own recurring analysis today

WHY THIS DECK EXISTS

The Databricks AI mandate is not "write the agent spec." It is owning the full loop from a research capability to a product a customer will run in production.

What that actually requires

A PM who can sit with engineering and research on what is technically buildable right now, not just what the roadmap deck says is buildable.

Direct customer contact to find which agent or model capability is worth shipping first, not a backlog ranked by internal opinion.

An analytics discipline (SQL, usage data) that tells you whether a shipped capability is actually being adopted, not just demoed well.

What I have already run

I built **SwipeHire** zero-to-one on the OpenAI API: wrote the PRD, scoped the MVP, shipped it to 50+ users, the same concept-to-launch arc this role asks for applied to an AI product specifically.

At **Sensata**, I ran 30+ structured customer interviews with OEMs and distributors to find new use cases before committing roadmap, then shipped against a 100+ item backlog 25% faster.

At **Applied Materials** today, I integrate AI agents built on Claude into my own recurring analysis, the same instinct for turning an AI capability into a working tool, pointed at my own job.

The through-line: every roadmap call I have made started with a customer conversation and ended with a number in SQL, whether the product was an AI matching tool or an industrial sensor line.

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Define the vision for enterprise generative AI and agent products... guide the roadmap from concept to launch."*

> *"Work closely with engineering and research to turn advances into products."*

> *"Engage with customers to identify new use cases... comfort with SQL and product analytics."*

My proof

SwipeHire, concept to launch: wrote the PRD, scoped the MVP and shipped an AI job-matching product zero-to-one on the OpenAI API, to 50+ users.

Sensata, roadmap owned with engineering: defined the product vision for sensor solutions and ran a 100+ item backlog with engineering in Agile across 3 regions, 25% faster releases.

Sensata, customer-sourced use cases: 30+ structured interviews with OEMs and distributors surfaced the use cases that became roadmap commitments, raising CSAT 22%.

SQL and product analytics: built KPI frameworks in SQL and GA4 across 50K+ connected devices to tell adoption from a good demo.

THE PROOF, IN DEPTH

Ship the capability, prove the adoption, then go back to the customer for the next use case.

The same three-step loop twice: build the thing zero-to-one, instrument it so the data tells the truth, then let customer contact decide what ships next.

50+ Users

Zero-to-One AI Product, Concept to Launch

SwipeHire: PRD, MVP and ship on the OpenAI API, with no playbook and no team to hand any of it to.

25% Faster

100+ Item Roadmap, 3 Regions, Agile

Sensata sensor-product roadmap, shipped with engineering across North America, Europe and APAC-equivalent regions.

30+ Interviews

Customer-Sourced Use Cases, Not Guesses

Structured OEM and distributor conversations that became roadmap commitments, raising CSAT 22%.

None of these were a roadmap slide that sat in a deck. Each one closed the loop from a technical capability to a number a customer or a business actually felt.

FIRST 30 DAYS

What the first month owning an agent or model product at Databricks AI looks like.

WEEK 1

Sit with engineering and research on what ships next

Map the current agent/model capabilities closest to production readiness, and find where a capability is technically done but has no customer-facing use case attached yet.

Why first: the same move behind the SwipeHire PRD: separate what is technically done from what a customer can actually use, before committing a roadmap slot.

WEEK 2-3

Run customer conversations on the use case most likely to ship first

Go direct to 10-15 target customers or internal champions to pressure-test which agent workflow earns a place on the roadmap first, the same discipline behind Sensata's 30+ OEM interviews.

Why now: a roadmap built from internal opinion ships the wrong thing well; one built from direct customer contact ships the right thing fast.

WEEK 4

Stand up the SQL-based adoption signal

Build the usage-analytics view that separates a well-demoed capability from one customers actually keep using, then automate its reporting with an AI agent so the signal updates every cycle.

Why this fast: the same SQL-and-GA4 habit from Sensata, and the same Claude-agent automation already running at Applied Materials today, not a plan for someday.

CLOSE

You are hiring someone to turn Databricks AI's model and agent capabilities into products customers trust with real workflows. I have run that exact loop, concept to launch, more than once.

The build half: **SwipeHire**, an AI product written, scoped and shipped zero-to-one on the OpenAI API to 50+ users, with no existing playbook to lean on.

The enterprise half: Sensata's sensor-product roadmap, a **100+ item backlog shipped 25% faster** across 3 regions with engineering in Agile, built on 30+ customer interviews that found the use cases worth shipping. At Applied Materials today I integrate AI agents built on Claude into my own recurring analysis, because the instinct to turn a capability into a working tool should not stop at the product boundary.
