Hiring Team, Sigma

Your posting draws a line between the IT leaders and data engineers who evaluate infrastructure and the line-of-business owners who just want the outcome, and asks one person to write for both. That split was the job at Sensata: positioning that had to hold up for OEM engineers who could spot a padded spec sheet and for the distributors who only cared whether the part sold, on a sensing-product launch that drove \$2M+ in first-year revenue and a 15% lift in conversion.

I built the enablement that carried that positioning into the field: decks, case studies and competitive one-pagers for 50+ reps, pressure-tested against 30+ structured interviews with OEMs and distributors before anything shipped. That is the same discipline a battlecard, a solution brief or a discovery-question framework needs: built from what reps actually hear on calls, not a guess about what a technical buyer wants.

At Applied Materials today, I size a fast-moving semiconductor market from Sales, Engineering and Accounts input and automate the repetitive half of that competitive analysis with AI agents built on Claude instead of rebuilding the same report every cycle. Sigma already screens candidates with AI tools of its own; I would bring that same habit of using the tools daily to writing about no-code app building and AI-assisted workflows, telling apart what is genuinely new from what is repackaged.

What I would bring to Sigma Apps is that arc, run once already: real technical depth translated into positioning, tested against the buyer, armed for the sellers, and tied to a revenue number. Proof trail at adhi-product-ai.vercel.app/ref/sigma.
