

PITCH DECK | MIXPANEL PRODUCT MANAGER

Every product-analytics company faces the same test on its own roadmap: does the next feature follow the cohort, or the loudest opinion in the room. I have already run that test twice.

Roadmap ownership, discovery and activation instrumentation from a PM who wires up his own funnel data instead of waiting on someone else's report.

100+ feature backlog owned end to end, releases 25% faster, time-to-market cut 20% (Sensata)

18% feature-adoption lift from SQL + GA4 cohort instrumentation across 50K+ devices

+25% activation lift on SwipeHire, an AI product built zero-to-one (PRD, MVP, GA4/GTM funnel)

30+ customer interviews turned into a roadmap that raised CSAT 22%

Claude AI agents in daily use to automate repetitive analysis at Applied Materials

The hard part is not more instrumentation. It is turning it into **a roadmap call before the opportunity goes cold.**

What a product-analytics company runs into on its own roadmap

Everyone can see the usage data, but a dashboard alone does not decide which of a hundred competing feature requests to build next.

Without a backlog anchored to adoption and retention cohorts, roadmap debates default to whoever argues loudest, not the clearest signal in the funnel.

The fix is not another metric. It is a PM who turns cohort behavior and customer conversations into a backlog engineering can actually execute against.

What I have already run, at smaller scale

At **Sensata**, I owned the roadmap and a 100+ feature backlog for a connected-device line, instrumenting SQL and GA4 cohort tracking across 50K+ devices to find which features actually moved adoption.

I paired that with **30+ customer interviews** so the backlog reflected what OEMs and distributors said, not just what the usage logs implied.

I run the same loop solo on **SwipeHire**: wrote the PRD, scoped the MVP, then instrumented my own GA4 and GTM funnel to find the activation drop-off instead of asking someone else to pull the report.

Roadmap ownership, product discovery and data-driven prioritization are the same loop: watch the cohort, talk to the user, ship the backlog item that moves both.

What a Product Manager at a product-analytics company usually owns, and where the proof already sits.

What the seat covers

Owns the roadmap and backlog for a core product surface, prioritized against usage and adoption data rather than instinct.

Runs discovery directly with customers and turns those conversations into shipped product decisions, not a research archive.

Partners daily with Engineering, Design and Data on cross-functional delivery, defending every backlog call with evidence.

My Proof

Roadmap and backlog ownership at Sensata: ran the sensor-line roadmap and a 100+ feature backlog with engineering in Agile across 3 regions, cutting time-to-market 20% and accelerating releases 25%.

Discovery that changed the backlog: 30+ customer interviews with OEMs and distributors surfaced pain points that reshaped the roadmap and lifted CSAT 22%.

Cohort instrumentation, not a dashboard for its own sake: SQL + GA4 KPI frameworks across 50K+ devices found the adoption signal that lifted feature adoption 18%.

Same loop, solo, on SwipeHire: wrote the PRD, scoped the MVP, then ran 8+ A/B tests on my own GA4/GTM funnel instrumentation, lifting activation 25%.

Own the roadmap, instrument the cohort, **let the data pick the next feature.**

Ran the product roadmap for sensor solutions across automotive and industrial segments, managing a 100+ feature backlog with engineering in Agile across 3 regions, the same cross-functional shape a product-analytics company's own roadmap runs on.

-20%

Time-to-Market Cut

A 100+ item backlog moved 25% faster once it was prioritized against real cross-functional data, not a rotating set of opinions.

+18%

Feature Adoption Lift

SQL and GA4 KPI frameworks across 50K+ connected devices surfaced the high-intent cohorts before adoption plateaued.

+22%

CSAT Lift

30+ customer interviews with OEMs and distributors turned pain points into shipped enhancements, not a backlog of complaints.

The same discipline runs on SwipeHire, an AI job-matching platform built zero-to-one: PRD, MVP scope, then GA4 and GTM funnel instrumentation to run 8+ A/B tests that lifted activation 25% across the first 50+ users. The common thread: instrument first, talk to the user second, ship the backlog item both point to.

What the first month on Mixpanel's product team looks like.

WEEK 1 Read the cohort before the backlog Pull the adoption and retention cohorts for the product surface I own, and sit with Engineering, Design and Support to hear where the current backlog already disagrees with what the data shows. ----- Why first: the same move that started the Sensata roadmap rewrite: let the usage data name the priority before anyone else does.	WEEK 2-3 Run discovery, not a survey Talk directly to 10-15 customers across the segments the cohort data flagged, then map every insight to a specific backlog item instead of a research summary nobody reopens. ----- Why now: the same pairing of interviews and cohort data that lifted CSAT 22% and reshaped the Sensata roadmap.	WEEK 4 Ship the prioritized backlog Turn the cohort findings and customer conversations into a ranked backlog with Engineering, each item defended by a signal, and agree on the first PRD to write together. ----- Why this fast: a backlog matters less if it stays a wish list. Shipping the ranking is what made the 100+ item backlog at Sensata move 25% faster.

CLOSE

You are hiring someone to turn Mixpanel's own product signal into a roadmap. I have already run that loop twice.

The core proof is Sensata: a **100+ feature backlog** owned end to end with engineering across 3 regions, releases **25% faster**, time-to-market cut **20%**, feature adoption up **18%** off SQL and GA4 cohort instrumentation, and CSAT up **22%** off 30+ customer interviews.

What is harder to find is a PM who has also built the instrumentation and the product from zero. **SwipeHire is that proof**: PRD, MVP scope, GA4/GTM funnel wired up by hand, 8+ A/B tests, activation up 25%. That is the same builder's instinct I would bring to a product-analytics company's own roadmap.
