

PITCH DECK | AIRWALLEX SENIOR PRODUCT MANAGER, T:0 (AGENTIC) FINANCE

Founders don't want more SaaS to manage their finances. They want the finance work done. I already built the part that makes an AI agent's financial decision explainable enough for a human to trust it.

Zero-to-one product instincts, an AI-native build habit, and founder-scale ownership, from someone who has shipped both the product and the trust layer underneath it.

PriceKeel - founder and CEO, built the explainable discount guardrail and audit trail Finance can check

SwipeHire - AI job-matching platform shipped zero-to-one on the OpenAI API to 50+ users

100+ features - product backlog built and owned zero-to-one at Sensata, releases 25% faster

AI agents on Claude - in production use today, Applied Materials

Cross-functional builder - Engineering, Sales, Accounts, no formal authority required

Building Agentic Finance from zero to one is not a roadmap exercise. It is **a trust problem wearing a product-strategy costume.**

What that actually requires

Inventing a new product and user experience with no existing playbook, then earning product-market fit with real founders who will drop it the moment it wastes their time instead of saving it.

An agent that touches payments, payroll, bookkeeping or tax has to be explainable enough that a founder trusts the output without re-checking it by hand, or the "eliminate the busywork" pitch just becomes more busywork.

Choosing the right AI approach per problem, prompting, fine-tuning, or a fully agentic workflow, instead of defaulting to whichever is trending, while working across engineering, design, commercial and the customer to ship it.

What I have already built at that trust layer

Founded **PriceKeel** to solve exactly this for pricing decisions: an explainable discount guardrail engine and the audit trail Finance can check, so a human decision stays fast without Finance losing the ability to verify it.

Shipped **SwipeHire**, an AI job-matching platform, zero-to-one on the OpenAI API, from PRD to 50+ onboarded users, owning the product surface and the AI tooling underneath it myself.

Automate the repetitive parts of pricing and market analysis today with **AI agents built on Claude** at Applied Materials, so I already default to matching the AI technique to the problem rather than the reverse.

The through-line: I do not just want to use AI. I have already built the part that makes people trust what it decides, which is the actual hard problem inside "Agentic Finance."

What the T:0 posting is asking for, and where the proof already sits.

What the role covers

- "Invent a new product and user experience, from strategy and solution design to iteration, roadmaps and delivery plans."*
- "Collaborate closely with engineering, design, commercial teams and most of all our customers to go from zero to one, build something people want, achieve PMF."*
- "Demonstrated experience in fields like AI, ML, LLM... previous experience as a startup founder or early joiner is highly desirable."*

My proof

- PriceKeel, founder and CEO:** invented the product, the guardrail engine and the audit trail from a blank page, and run the pilots and the investor narrative myself.
- SwipeHire, zero-to-one:** wrote the PRD, scoped the MVP, shipped on the OpenAI API, and owned the GTM and analytics stack that told me whether anyone actually wanted it.
- Sensata:** took the sensor line from a blank roadmap to a 100+ feature backlog zero-to-one across 3 regions, grounded in 30+ structured customer interviews, not a stakeholder wishlist.
- Applied Materials today:** AI agents built on Claude in production use, plus cross-functional sizing work with Engineering, Sales and Accounts with no formal authority over any of them.

Sensata: blank roadmap to a 100+ feature backlog, grounded in the people who had to live with it.

Built as the product roadmap and backlog for a new sensor line, owned end to end in Agile across 3 regions, not handed down as a spec to execute.

30+

Structured Customer Interviews

OEM and distributor engineers, the people who had to integrate against whatever shipped, before a single PRD got written.

100+

Feature Backlog, Built Zero-to-One

Strategy, prioritization and delivery owned end to end across 3 regions, using Agile as the operating cadence, not the pitch.

25% / 20%

Faster Releases / Shorter Time-to-Market

The result of grounding backlog priority in adoption signals from SQL and GA4 across 50K+ devices, not opinion.

The same instinct runs through PriceKeel: I designed the guardrail engine and the audit trail before writing a line of marketing copy, because an agent handling a Finance decision has to earn trust before it earns adoption.

What the first month building inside T:0 would look like.

WEEK 1 Sit with the problem, not the roadmap Talk to founders and the customers this product is for, plus engineering and design, to find exactly where finance busywork hurts today, the same move that grounded the Sensata backlog before any PRD. ----- Why first: a zero-to-one roadmap built on assumptions instead of real conversations is the fastest way to miss PMF.	WEEK 2-3 Ship a narrow agentic slice, then measure trust Build the smallest version of the workflow and instrument it the way SwipeHire's analytics stack was instrumented, to learn whether founders trust the output enough to stop double-checking it by hand. ----- Why now: usage without trust is a false PMF signal for a product handling someone's finances.	WEEK 4 Turn the first proof point into a roadmap Use what shipped and what founders actually trusted to write the roadmap and delivery plan for what comes next, the same handoff that took Sensata's backlog from one region's pilot to a 3-region rollout. ----- Why this fast: a zero-to-one product only earns its next investment by showing the path to scale.
---	---	--

CLOSE

T:0 needs someone who has already built the part of Agentic Finance most teams skip: the reason a human trusts what the agent decided.

The core proof is PriceKeel and Sensata together: [an explainable guardrail engine and audit trail](#) I designed myself, and a [100+ feature product backlog](#) I took from zero to one, grounded in 30+ real customer conversations.

What's harder to find is someone who has done that zero-to-one product work inside a large organization [and](#) is doing the founder-level version of it, end to end, right now. That is the founder-or-early-joiner mindset this posting is asking for.
