Hiring Team, Adobe

At Sensata I led the Bleeders and Leakers program: segmented 1,200 pricing opportunities by region, product family and product line against a $627M target, flagged $433M in margin gaps, and recovered $700K plus in margin in two quarters while lifting distributor margins from 53% to 61%. That is the pricing and packaging work your posting describes, run inside a multi-$100M business with Finance, Sales and Engineering all touching the same decision.

The financial-modeling side of the role is the same discipline I already run. I build R-based regression models to forecast demand elasticity and find profit-maximizing price points, and at Applied Materials I build inflection-point forecasting and scenario models across multiple product groups, the market-penetration, revenue and margin estimates a pricing recommendation needs before it earns executive approval. At Sensata those models turned into the AP26 revenue models and multimillion-dollar customer quotes I built alongside senior executives and Finance, and into the decks that won approval for every pricing move along the way.

On the GenAI side, I am not approaching this from theory. I founded PriceKeel, a decision-integrity layer for B2B SaaS deal pricing, where I built a guardrail engine that recommends an explainable discount boundary learned from a company's own closed-won and closed-lost deals, plus the audit trail that gives Finance a record it can act on. At Applied Materials I run that same automation instinct on AI agents built on Claude, which is a practical, hands-on read on what agentic tooling can and cannot do inside a pricing workflow, not a slide about the category.

Pricing a Creativity and Productivity portfolio that is actively being reshaped by GenAI and agentic features is a different surface than industrial parts, but the loop is the same one I have been running: segment the data, model the scenario, win the room, document the decision so it survives the next quote-to-cash handoff.
