PITCH DECK | DOORDASH SENIOR ASSOCIATE, NEW VERTICALS - GROCERY STRATEGY & OPERATIONS

A new grocery customer's second order decides whether this vertical scales. I have already built the dashboard that tracks that decision every week, and the research discipline that earns it.

1,200 opportunities tracked against a $627M target, 30+ willingness-to-pay interviews before a single positioning line was written, and the AI-agent habit that turns a week of analysis into an afternoon.

- **$433M in margin gaps surfaced** from a tracking dashboard built from scratch at Sensata
- **30+ interviews** with OEMs and distributors before committing to a positioning
- **+15% conversion** from positioning rebuilt on what customers actually said
- **150+ facilities analyzed** sizing a market from zero, no existing model to start from
- **AI agents built on Claude** automating recurring analysis today

WHY THIS DECK EXISTS

This req is not a marketing-channel job. It is deciding which onboarding lever actually moves a first-time grocery order to a second one, and proving it with a number every week.

What Grocery actually needs right now

Analyze consumer behavior data and improve the onboarding journey so a new customer becomes a repeat Grocery customer.

Own the tracking dashboard and the week-over-week metrics that say whether a growth or quality initiative is actually working.

Build models in Excel and SQL, increasingly with AI, to weigh a program's costs and benefits before it scales.

What I have already built, the same way

At **Sensata**, built the Bleeders and Leakers dashboard from scratch: 1,200 opportunities tracked weekly against a $627M target, surfacing $433M in margin gaps.

Ran **30+ structured interviews** with OEMs and distributors before writing a single positioning line, the same research-before-launch sequence a personalized onboarding journey needs.

Automate the repeatable half of that analysis today with **AI agents built on Claude** at Applied Materials.

> The through-line: a tracking dashboard only earns trust once someone is already in the habit of building one from nothing, every single week.

THE MANDATE, MAPPED

What the posting asks for, in its own words, and where the proof already sits.

What the role covers

> *"You'll analyze consumer behavior data, improve the onboarding journey and drive sustained growth to Grocery & New Verticals."*

> *"Own tracking dashboards and manage week over week metrics to drive high quality operations."*

> *"Build models using Excel and SQL... and increasingly use AI to accelerate and deepen that analysis."*

> *"You solve problems from first principles... translate high-level goals into actionable plans."*

My proof

Sensata Bleeders & Leakers dashboard: 1,200 pricing opportunities tracked weekly against a $627M target, $433M in margin gaps surfaced for leadership.

30+ structured interviews: with OEMs and distributors, reading buyer behavior before a single positioning line was written.

Forecasting and market-sizing models: built in Excel and SQL at Applied Materials, now accelerated with AI agents built on Claude.

Safran market-sizing project: TAM/SAM/SOM built from 170 facilities to a SAM of 28 with no existing model to start from, presented to Safran leadership.

THE PROOF, IN DEPTH

Research first, then let the numbers decide whether a bet scales.

Three different environments, same sequence: build the dashboard, run the research, let the answer decide the next move before the spend goes up.

$433M Margin Gaps

Surfaced From A Dashboard Built From Scratch

The Sensata Bleeders & Leakers Power BI dashboard, 1,200 opportunities tracked weekly against a $627M target.

30+ Interviews

Before The Positioning Was Written

Structured willingness-to-pay research with OEMs and distributors, run before the launch plan, not validated after it.

+15% Conversion

From Positioning Rebuilt On The Answers

The interviews changed what got said, not just how it was said, on priority launches.

None of these numbers existed before someone built the tracking tool and asked the audience first. That is the habit, not a one-time result.

FIRST 30 DAYS

What the first month sizing and testing a Grocery onboarding fix looks like.

WEEK 1

Size the funnel and form the hypothesis

Pull what new Grocery customers already do in their first session (onboarding drop-off, support tickets, cohort data), size the addressable opportunity, and write the hypothesis for the segment most likely to reorder.

Why first: the same first-principles sizing behind the semiconductor market view at Applied Materials.

WEEK 2-3

Run the research and build the tracking dashboard

Design and run the interviews and concept tests that explain the drop-off, and stand up the SQL/Excel dashboard that will carry week-over-week metrics once the pilot launches, working with Growth, Quality, Design and Product.

Why now: the same 30+-interview discipline that decided Sensata's positioning before it shipped.

WEEK 4

Launch the pilot and automate the read

Ship the onboarding fix as a small-scale pilot, wire the dashboard that tells scale from iterate from stop, and bring the first AI-agent-automated version of that weekly report.

Why this fast: the same AI-agent habit already running at Applied Materials today.

CLOSE

You are hiring someone to turn a first-time grocery order into a habit, and prove it with a dashboard that updates itself. I have already built both halves of that job.

At **Sensata**, the tracking-dashboard half: 1,200 opportunities tracked weekly against a **$627M** target, and **$433M** in margin gaps surfaced for leadership to act on by salesperson and product line.

At Sensata again and at **Applied Materials**, the research-and-AI half: **30+** structured interviews run before a single positioning line was written, and the AI-agent habit that turns a week of analysis into an afternoon, running today on AI agents built on Claude.
