Hiring Team, Roku

Your posting talks about running pricing and routing experiments and modeling supply-demand elasticity across publisher integrations. That is close to the model I built at Sensata: a BU-wide price-increase model in Power BI that flagged which line items could lift profitability more than 50% once pricing and routing changed, then I led the rollout with Sales. It recovered $700K+ in margin in two quarters and raised distributor and channel-partner margins from 53% to 61%.

I also know the demand side of the exchange. At Pixis I ran programmatic and retail-media campaigns across Amazon Ads, Criteo and DSPs for an 8-client, $15K-$90K/month portfolio, and the job was always the same: figure out which signals actually drove ROAS versus which ones just looked good in a dashboard. That instinct, test the signal before you trust it, is what I would bring to deciding which publisher data is worth enriching the ad request with.

On the product side, I own the roadmap and a 100+ feature backlog for sensor integrations at Sensata, working with engineering in Agile across 3 regions and standardizing how new launches moved through channel and distributor partners, work that cut time-to-market 20%. At Applied Materials now I automate repetitive analysis with AI agents built on Claude, so I would bring that same habit to a team standardizing publisher integrations at scale.

I would welcome the chance to talk through how this maps to the Supply Integrations roadmap. Proof trail at adhi-product-ai.vercel.app/ref/roku.
