

PITCH DECK | AWS SPECIALIST STRATEGY & SALES OPERATIONS LEAD

ASP is scaling fast enough that a KPI definition agreed on in one business review and reinterpreted in the next is not a small thing. It is where forecast accuracy and AI tool adoption both stall out.

Standardized sales processes, pipeline qualification and attribution, and AI-human collaboration in sales tooling, built once already by someone who has run all three at the same time.

1,200 opportunities, \$627M target tracked in a Power BI pipeline dashboard I built and ran business reviews on

53% to 61% channel margin recovered by standardizing a pricing process across distribution

AI agents built on Claude automating my own forecasting and reporting work today

50+ reps onto a new pitch, not just trained on one, the adoption half of any sales tooling rollout

CRM, CPQ, forecast and pipeline reviews that I run myself as founder of PriceKeel

The role is not "write down the process." It is making a standardized process, a shared set of KPI definitions, and a new AI tool **all survive contact with a fast-growing sales org at once.**

What that actually requires

A documented process only works if the people running quota against it agree on what each KPI means, or a business review turns into an argument about definitions instead of performance.

Pipeline qualification and attribution has to be resolved consistently, or the same deal gets counted twice, or not at all, and forecast accuracy erodes from the bottom up.

AI sales intelligence tools only help if sellers actually adopt them, which is a training and change-management problem sitting right next to the technical rollout, not after it.

What I have already run

At **Sensata**, I built the KPI definitions and the Power BI dashboard a whole business unit ran its weekly and quarterly reviews on, across 3 regions and 20 product lines.

At **PriceKeel**, the company I founded, I run CRM, CPQ, forecast and pipeline reviews, and deal approvals myself, with an audit trail Finance can check the human decision against.

At **Sensata** again, I built the sales enablement that got 50-plus reps onto a new pitch, and at **Applied Materials** today I run my own analysis on AI agents built on Claude.

The through-line: every process I have standardized had to hold up under a live business review with real revenue behind it, and every tool I have rolled out had to get adopted, not just documented.

What the posting asks for, and where the proof already sits.

What the role covers

- "Documents and implements standardized sales processes and metrics, including KPI definitions and goal cascades."*
- "Develops and manages pipeline qualification, attribution, to ensure proper distribution, and resolves attribution escalations."*
- "Orchestrates AI-human collaboration in the sales process, and manages and optimizes AI sales intelligence tools."*
- "Prepares and drives regular business reviews with insights on pipeline health, performance trends, and operational efficiency."*

My proof

- Sensata, KPI definitions at scale:** built the win rate, average dollar per win and pipeline-stage KPIs that a business unit's weekly and quarterly reviews were built on, across 1,200 opportunities and a \$627M target.
- Sensata, pipeline handoff:** ran campaigns that generated 35% more qualified leads, then watched Sales qualify and forecast against that same pipeline, so I know exactly where attribution breaks between two teams.
- Applied Materials, AI-human collaboration:** automate my own recurring forecasting and market-sizing analysis with AI agents built on Claude, not a pilot I ran once for a demo.
- PriceKeel, sales tools data quality:** run CRM, CPQ, forecast and pipeline reviews myself, and built the audit trail that keeps the underlying data trustworthy enough for Finance to sign off on.

Build the KPI framework, run the business review on it, then **standardize the process until the number moves.**

Same pattern across two roles at one company: define how a metric gets measured, put it in front of leadership on a fixed cadence, then change the underlying process until the metric improves.

\$627M

Pipeline Target, 1,200 Opportunities Tracked

Power BI dashboard across 3 regions, 4 product families and 20 product lines: pipeline funnel, win rate, avg dollar per win and stage distribution by salesperson and product line.

53% to 61%

Channel Margin, Under 2 Quarters

Standardized the pricing process across distribution partners, then repriced parts sold through that channel to move the number, not just report it.

+30% Win Rate

Sales Enablement, 50+ Reps

Built the decks and case studies that got a distributed rep base actually using a new pitch, the adoption half of any process or tooling rollout.

The common thread: none of these were a metric defined once and left alone. Each one got re-measured on a fixed review cadence until the underlying process changed.

What the first month inside ASP's sales operations looks like.

WEEK 1

Map today's KPI definitions and business review flow

Sit with the ASP leaders and sellers who run today's business reviews, and document where a metric means one thing in one team's deck and something else in another's, before touching any tooling.

Why first: the same first move behind the Sensata dashboard, listening to how a number actually gets used before redefining it.

WEEK 2-3

Standardize one pipeline qualification and attribution rule

Pick the qualification or attribution rule causing the most escalations, resolve it with Finance and the sellers who feel it, and document it as the KPI definition and goal cascade the next business review runs on.

Why now: the same standardize-until-the-number-moves habit that raised Sensata's channel margin from 53% to 61%.

WEEK 4

Pair one AI sales intelligence tool with an adoption plan

Take one AI-driven tool already in flight for ASP, build the training and workflow automation that gets sellers actually using it, and measure adoption the same way I measured rep pitch adoption at Sensata.

Why this fast: the same habit that keeps my own reporting moving on AI agents at Applied Materials today, not a plan for someday.

CLOSE

You are hiring someone to make a standardized process, a shared KPI language, and a new AI tool all hold up under a live business review. I have already run that pattern at Sensata, at scale.

The core proof is one Sensata arc: a **\$627M pipeline, 1,200 opportunities** tracked against KPI definitions I built myself, feeding weekly and quarterly business reviews, then a **53% to 61%** channel margin move once the underlying pricing process was standardized to match.

What is harder to find is someone who has already made AI part of their own sales-adjacent analysis, not a slide about AI. At Applied Materials I automate my own forecasting and market-sizing work with agents built on Claude, and at Sensata I built the enablement that got 50-plus reps onto a new pitch, because a rollout only counts once people actually use it.
