Hiring Team, Sierra

When Sensata's new sensing line needed a launch story that would actually hold up with OEMs and distributors, I wrote the positioning, ran 30+ customer interviews to pressure test it, then built the sales-enablement decks, case studies and playbooks that 50+ reps carried into the field. The line closed its first year at $2M+ in revenue and win rates moved 30%. That is the loop your posting describes: shape the message for the buyer in front of you, hand sales something they will actually use, then move to the next launch.

I already run the AI-first half of that loop day to day. At Applied Materials I automate recurring go-to-product analysis with AI agents built on Claude instead of redoing the same spreadsheet work every cycle, which is the same instinct behind building AI-first automations and templates so a launch does not start from a blank page. I have also worked the full range your posting calls out: owning one launch end to end across North America and Europe at Sensata, and managing a tighter, faster-moving book at Pixis, where I kept positioning and sales assets current across an 8-client portfolio on a lean team.

What I would bring on top of the launch work itself is the habit of templating what works instead of rebuilding it each time. The competitive-pricing dashboard I built at Sensata only mattered because it turned ad hoc calls into a repeatable system that held past one quarter; I would want to do the same with Sierra's messaging and sales assets, whether that means going broad across a set of launches or going deep on one industry or persona, whichever the team needs most.
