Hiring Team, Samsung Semiconductor

At Sensata I led pricing for a multi-$100M industrial business unit, recovering $700K+ in margin in two quarters and raising distributor and channel-partner margins from 53% to 61%, while shaping multimillion-dollar customer quotes directly with senior executives. That is the same muscle your Automotive memory team is asking for: pricing and allocation decisions that hold up against OEM and Tier-1 negotiating pressure while supply stays tight.

I also ran GTM for new sensing products at Sensata for automotive and industrial customers, working directly with OEMs and distributors from positioning through launch, and I led the TAM/SAM model and pricing feasibility case for a market-sizing engagement with Safran, narrowing 170 facilities down to a credible 28-facility serviceable market. Both are closer to this job description than a generic marketing background: tracking a market by segment, forecasting its size, and turning that into a pricing position Sales can actually use.

At Applied Materials I now build value-based pricing and forecasting models for a fast-growing semiconductor business, and I automate the repetitive parts of that analysis with Claude AI agents so more time goes into judgment calls, like which customer project needs priority support as it moves from RFQ through qualification into mass production.
