Hiring Team, Pylon

Your posting says owning a product area means going from discovery through launch, adoption and iteration yourself, not handing pieces to other people. I have done that twice: I wrote the PRD, scoped the MVP and shipped SwipeHire's AI-driven job matching to 50+ early users on my own, and at Sensata I owned a 100+ feature backlog for sensor solutions end to end with engineering in Agile across 3 regions, cutting time-to-market 20%.

"Start with evidence" is already how I work. I ran 30+ structured interviews with OEMs and distributors before I trusted a roadmap call, and 12+ user interviews plus 8+ A/B tests before I trusted SwipeHire's onboarding flow. Both times the data moved the plan more than my first instinct did, which is the point of living the persona instead of guessing at it.

I will take the "argue with us" line at face value: an agentic support platform's hardest product call is not deciding what the agent can automate, it is deciding what a human still needs to see before the agent acts, and that line should move as trust in the system grows rather than stay fixed from launch day. I make that same automate-versus-verify judgment daily at Applied Materials, building AI agents on Claude to take over repetitive analysis while I keep the calls that still need a human read.

I would like to own a product area at Pylon the same way, in San Francisco, in person. Proof trail at adhi-product-ai.vercel.app/ref/pylon.
