Hiring Team, Tanium

Your posting says PMs on this team author the specs that drive engineering execution in a spec-driven, AI-assisted process. I run that loop today: at Applied Materials I automate repetitive analysis work with AI agents built on Claude so forecasts and requirements move from signal to decision faster, the same shift from manual grooming to AI-assisted spec writing you are asking this role to own for AI Core Services.

I have also carried that discipline end to end on a product, not just a process. At Sensata I owned the roadmap and a 100+ feature backlog across engineering teams in 3 regions, grooming priorities and acceptance criteria myself and shipping releases 25% faster while cutting time-to-market 20%. None of that backlog order was a guess: 30+ structured interviews with OEMs and distributors surfaced where the product broke for them, support escalations included, and that discovery work lifted CSAT 22% once the fixes landed.

The cross-functional half of the role is familiar too. I built sales enablement material and case studies that product marketing and support teams used to land new capabilities with 50+ reps, improving win rates 30%, and I tracked OKRs with SQL and GA4 cohort data across 50K+ connected devices rather than reporting shipped features and calling it done. Influence without a PM title attached is also not new: at Sensata that roadmap and backlog work ran alongside engineering, sales and distributor partners who did not report to me.

I would welcome the chance to talk through how I would spec the first capability for AI Core Services. Proof trail at adhi-product-ai.vercel.app/ref/tanium.
