Hiring Team, Column

At PriceKeel, the company I founded, I built a guardrail engine that flags a discount exception against the pattern of a company's own closed-won and closed-lost deals, then keeps the audit trail Finance can actually check instead of trusting someone's memory of why a deal got approved. That is close to the shape of the problem you describe: a risk judgment that today lives in spreadsheets and tribal knowledge, where someone has to decide which of those calls a machine can make safely and which one a person still has to make by hand. I have already built that decision once, from a blank page.

The cross-functional half of the role is not new either. At Applied Materials I take input from Sales, Engineering and Accounts on a market that most people describe in hallway conversations, and turn it into one forecasting model everyone can work off instead of arguing from memory. I run that same synthesis with AI agents built on Claude, using them to decide which repetitive calls a script should make and which still need a person's judgment, the same split your platform needs at a much higher stake.

I have also shipped the "turn a messy problem into an actual product" work before, not just planned it. At Sensata I owned the roadmap and a 100+ feature backlog for sensor products with no existing playbook to inherit, running Agile with Engineering across three regions and cutting time-to-market 20%. Before that, as Pricing Lead, I built the rule-based flagging model behind the Bleeders and Leakers program, the system that caught where a deal was quietly losing margin across 1,200 pricing opportunities, and it recovered \$700K+ in two quarters. Both were "how do we know something's wrong" problems before I got there.

I would bring that same pattern, build the rules first, then the product around them, to Column's Risk platform. Proof trail at adhi-product-ai.vercel.app/ref/column.
