Hiring Team, Avathon

Your platform turns asset and grid data into autonomous operating decisions for energy and critical-resources operators. I have closed that same distance from raw signal to decision twice already: once on 50,000+ connected industrial sensors at Sensata, and once on hydrogen energy operations at Plug Power.

At Sensata I owned the product roadmap and a 100+ feature backlog for connected sensing devices across automotive and industrial segments, running 30+ interviews with OEMs and distributors to find where reliability and uptime data actually changed a customer's operating decision. Those interviews, plus KPI frameworks built in SQL and GA4 on the sensor fleet, accelerated releases 25%, cut time-to-market 20% and lifted feature adoption 18%, the same discovery-to-shipped loop a production-optimization and asset-reliability roadmap runs on.

The energy side is not adjacent, it is direct. At Plug Power I owned marketing budgets and forecasts across multiple business units at a hydrogen fuel cell company, presenting plans to leadership for approval and running the same operating cadence, OKRs plus weekly and quarterly reviews, that a grid-operations roadmap needs. A BE in Mechanical Engineering sits under both roles, so the physical systems your product reasons about are already familiar ground.
