Hiring Team, RELX

Your posting for Property Intelligence asks for someone who can build and maintain KPI reporting that tells the team whether a platform initiative is actually working. I built that exact thing at Sensata: a Power BI dashboard tracking 1,200 pricing opportunities against a $627M target across 3 regions and 20 product lines, with a pipeline funnel, regional scorecards, win rate and stage distribution baked in, so leadership could see progress against strategic goals without asking me for a status update.

The other half of the role, gathering customer and stakeholder input and turning it into requirements the team can act on, is how I already run a roadmap. I ran 30+ structured interviews with OEMs and distributors at Sensata, fed what I heard into a 100+ feature backlog, and used that feedback loop to lift CSAT 22% and feature adoption 18%. I also know what it takes to enable sales and internal stakeholders on a platform's capabilities and direction: I built the case studies and decks that lifted a 50-rep sales team's win rates 30%.

On the agentic-workflows piece specifically: I am not picking this up for the first time on your roadmap. At Applied Materials I already automate repetitive analysis with AI agents built on Claude, and I built SwipeHire, an AI job-matching platform, zero-to-one on Python and OpenAI's API to 50+ users. Pairing product judgment with agentic tooling to support a wider product team is a habit I run daily, not a new skill I would be building on the job.

I would welcome 15 minutes to talk through how this maps to the Property Intelligence roadmap. Proof trail at adhi-product-ai.vercel.app/ref/relx.
