Hiring Team, Zendesk

Your posting describes an operating model, not a single campaign type: 1:1, 1:few and scaled programs running at once, each needing its own industry play, its own campaign kit, its own paid media plan. At Sensata I ran the version of that for sensing products: positioning, pricing, channel and launch built as one industry-specific GTM play across North America and Europe, then handed to a 50-rep sales team as a campaign kit, battlecards, decks, case studies, that moved their win rate 30%. That is the ABX job in miniature: build the play once, arm the team, then watch what it does to pipeline.

The paid media and account-targeting side is not new either. At Plug Power I ran Paid Search and Paid Social across Google, Microsoft, Meta and LinkedIn for priority-account and cohort campaigns on a $100K/month budget, and bid optimization cut CPA 25%. At Pixis I ran paid media across an 8-client portfolio, $15K-$90K per client per month, including retail media and programmatic DSPs, so I am used to running several account-level media plans at once rather than one campaign at a time.

The engagement-signal half of this role is where I spend most of my time day to day. At Sensata I built KPI frameworks in SQL and GA4 across 50,000+ connected devices to flag the cohorts actually showing intent before a rep ever opened the account, and I built the FY2026 pipeline dashboard in Power BI, 1,200 opportunities against a $627M target across 3 regions, with funnel stage and win rate by region so leadership could see where the pipeline impact actually was. At Applied Materials now, I automate the recurring side of that analysis with AI agents built on Claude, which is the same responsible-AI habit your posting is asking an ABX owner to bring to campaign workflows.

I would welcome the chance to talk through how the Sensata launch-and-enablement work and the Plug Power and Pixis paid-media work map onto Zendesk's ABX motion. Proof trail at adhi-product-ai.vercel.app/ref/zendesk.
